1.3 **Chassis Overview**

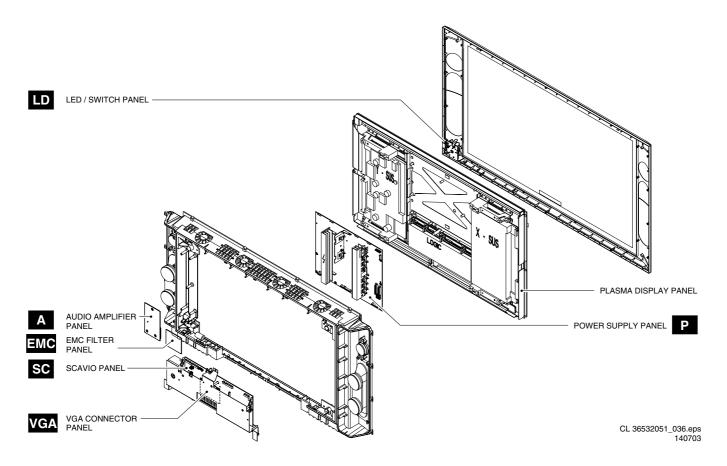

Figure 1-6 PWB Location

Safety Instructions, Warnings, and Notes

2.1 **Safety Instructions**

Safety regulations require that **during** a repair:

- Connect the set to the mains via an isolation transformer (=
- Do not operate the monitor without the front glass plate. One function of this glass plate is to absorb IR radiation. Without this glass plate, the level of radiation could damage your eyes.
- Replace safety components, indicated by the symbol **A**, only by components identical to the original ones.

Safety regulations require that after a repair, the set must be returned in its original condition. Pay, in particular, attention to the following points:

- Route the wire trees correctly and fix them with the mounted cable clamps.
- Check the insulation of the mains lead for external
- Check the electrical DC resistance between the mains plug and the secondary side (only for sets which have a mains isolated power supply):
 - 1. Unplug the mains cord and connect a wire between the two pins of the mains plug.
 - 2. Set the mains switch to the "on" position (keep the mains cord unplugged!).
 - 3. Measure the resistance value between the pins of the mains plug and the metal shielding of the tuner or the aerial connection on the set. The reading should be between 4.5 Mohm and 12 Mohm.
 - 4. Switch "off" the set, and remove the wire between the two pins of the mains plug.
- Check the cabinet for defects, to avoid touching of any inner parts by the customer.

2.2 Warnings

- All ICs and many other semiconductors are susceptible to electrostatic discharges (ESD &). Careless handling during repair can reduce life drastically. Make sure that, during repair, you are connected with the same potential as the mass of the set by a wristband with resistance. Keep components and tools also at this same potential. Available ESD protection equipment:
 - Complete kit ESD3 (small tablemat, wristband, connection box, extension cable and earth cable) 4822 310 10671.
 - Wristband tester 4822 344 13999.
- Be careful during measurements in the high voltage
- Never replace modules or other components while the unit is switched "on".
- When you align the set, use plastic rather than metal tools. This will prevent any short circuits and the danger of a circuit becoming unstable.

2.3 Notes

- Clean the glass plate in front of the plasma display with a slightly humid cloth. If, due to circumstances, there is some dirt between the glass plate and the plasma display, this must be cleaned by a qualified service engineer (see
- Measure the direct voltages and oscillograms with regard to the chassis ground $(\frac{\bot}{+})$, or hot ground $(\frac{\bot}{+})$ as this is
- The direct voltages and oscillograms shown in the diagrams are indicative. Measure them in the Service Default Mode (see chapter 5).
- Where necessary, measure the voltages in the power supply section both in normal operation (1) and in standby

- (b). These values are indicated by means of the appropriate symbols.
- The semiconductors indicated in the circuit diagram and in the parts lists, are interchangeable per position with the semiconductors in the unit, irrespective of the type indication on these semiconductors.

2.3.1 Schematic Notes

- All resistor values are in ohms and the value multiplier is often used to indicate the decimal point location (e.g. 2K2 indicates 2.2 kohm).
- Resistor values with no multiplier may be indicated with either an "E" or an "R" (e.g. 220E or 220R indicates 220
- All capacitor values are expressed in micro-farads (µ= $x10^-6$), Nano-Farads (n= $x10^-9$), or pico-farads (p= $x10^-$
- Capacitor values may also use the value multiplier as the decimal point indication (e.g. 2p2 indicates 2.2 pF).
- An "asterisk" (*) indicates component usage varies. Refer to the diversity tables for the correct values.
- The correct component values are listed in the Electrical Replacement Parts List. Therefore, always check this list when there is any doubt.

2.3.2 Rework on BGA (Ball Grid Array) ICs

Although (LF)BGA assembly yields are very high, there may still be a requirement for component rework. By rework, we mean the process of removing the component from the PWB and replacing it with a new component. If an (LF)BGA is removed from a PWB, the solder balls of the component are deformed drastically so the removed (LF)BGA has to be discarded.

Device removal

As is the case with any component, it is essential when removing an (LF)BGA, that the board, tracks, solder lands, or surrounding components are not damaged. To remove an (LF)BGA, the board must be uniformly heated to a temperature close to the reflow soldering temperature. A uniform temperature reduces the chance of warping the PWB To do this, we recommend that the board is heated until it is certain that all the joints are molten. Then carefully pull the component off the board with a vacuum nozzle. For the appropriate temperature profiles, see the IC data sheet.

Area preparation

When the component has been removed, the vacant IC area must be cleaned before replacing the (LF)BGA. Removing an IC often leaves varying amounts of solder on the mounting lands. This excessive solder can be removed with either a solder sucker or solder wick. The remaining flux can be removed with a brush and cleaning agent.

After the board is properly cleaned and inspected, apply flux on the solder lands and on the connection balls of the (LF)BGA. Note: Do not apply solder paste, as this has shown to result in problems during re-soldering.

Device replacement

The last step in the repair process is to solder the new component on the board. Ideally, the (LF)BGA should be aligned under a microscope or magnifying glass. If this is not possible, try to align the (LF)BGA with any board markers. To reflow the solder, apply a temperature profile according to the IC data sheet. So as not to damage neighbouring components, it may be necessary to reduce some temperatures and times.

Note: when High Definition signals are inputted to the monitor via the YPbP/IRGB input, the monitor switches to the HD Video Mode. The following HD and SD video modes are supported by the monitor on the YPbPr, RGB and VGA2 HD input 1920×1080/60I

720×480/60P 720x576/50P

1280×720/60P

The following SD video modes are supported by the monitor on the YCbCr input: 720×480/601 720×576/501

Note: you should make the correct selection for AV3 in the Setup menu, p. 8.

Use of the menus

High Definition equipment with VGA connector

Connect the VGA output of your equipment to the VGA2 connector.

Connect the audio cables to the equipments AUDIO L and R sockets and to the VGA2 AUDIO L and R sockets on the monitor.

Note: you should select HD IN for VGA2 in the Setup menu. (See p. 8)

Digital DVI output of your PC (DVI-D)

Connect the Digital DVI output of your PC to the DVI-D connector.

Connect the audio cables to the DVI-D AUDIO L and R sockets on the

RC out connector

This connector allows you to daisy chain remote control signals to other equipment (e.g. AV receiver, IR repeater) which have an electrical RC in.

Note: it is not possible to daisy chain a second monitor

Serial I/O port RS232

The RS232 connector is only to be used with the monitor as stand alone. This connector allows you to control the monitor via your PC (as a replacement of the remote control). Software is supplied on CD-ROM.

Note: This connector can also be used for dealer service tools.

Supplied driver software

Mechanical Instructions

Index of this chapter:

- Service Positions Monitor
- Rear Cover Removal
- Service Position Panels
- PDP and Glass Plate Replacement
- Re-assembly

Note: Figures below can deviate from the actual situation, due to different set executions.

4.1 **Service Positions Monitor**

Transport Cushions

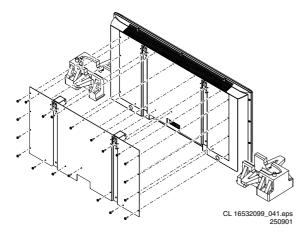

Figure 4-1 Transport cushions

First, put the monitor in its service position. Therefore, disconnect all cables connected to the monitor and take the monitor of the wall (or tabletop stand). Then, place the monitor in the re-enforced transport cushions that function also as service stand (you can order them separately under code 3122 126 40612). See figure "Transport cushions".

Notes:

- There are no special "re-enforced service stands". The cushions used in the factory packaging are already made of reinforced material.
- Always keep in mind that the stands are only designed to keep the monitor in service position as long as the monitor is being serviced. The stands are NOT designed to keep the monitor in the upright position for more then two days.
- After the monitor is serviced, or when nobody is working on the monitor (e.g. in the weekend), it should be removed from the stands and laid down on a cushion or other support system to prevent it from falling.
- Worn out stands should be replaced by new ones (monitor will tilt to much forward).
- Never leave the monitor alone when the stands are not fully pressed on its place.
- It is possible to move the right stand a bit to the right so that you can access the IR-LED and ON/OFF switch, but the monitor can then not be left alone because the stands are NOT designed to carry the weight of the monitor in that position. A better solution to access the IR-LED and/or ON/ OFF switch is to make some holes in the stands at the position of the LED and switch. Do not make the holes to big, as this will influence the strength of the stands.

Aluminium Stand:

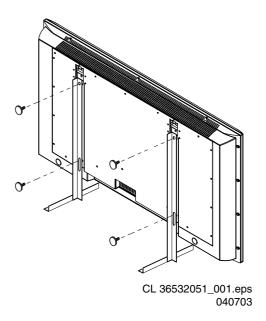

Figure 4-2 Aluminium stand

The aluminium stand (order code 3122 785 90480) can be mounted with the back cover removed or still left on. So, the stand can be used to store products or to do measurements. It is also very suitable to perform duration tests without taking much space, without having the risk of overheating and no risk of products falling. The stand can be mounted and removed quickly and easy with use of the delivered screws that can be tightened and loosened manually without the use of tools. See figure above.

Note: Only use the delivered screws to mount the monitor to the stand.

413 Foam Stand:

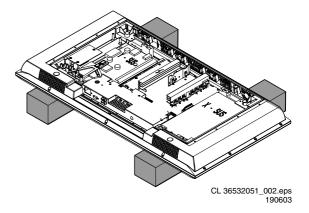

Figure 4-3 Foam stand

The foam stand (order code 3122 785 90580) can be used for all types and sizes of FTVs and LCD TVs and can even be used to e.g. exchange a CRT of a normal TV. By laying the plasma or LCD TV flat on the (ESD protective) foam bars, a stable situation is created to perform measurements and alignments. See figure "Foam stand".

By first placing a mirror flat on the table under the TV you can easily see if something is happening on the screen. The stand is also handy to replace the screen (PDP or LCD).

4.2 **Rear Cover Removal**

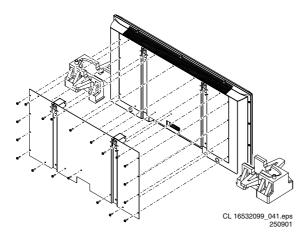

Figure 4-4 Rear cover removal

To be able to access or measure the panels, remove the rear cover (metal back plate):

- 1. Remove all fixation screws from the back plate, as indicated in figure above (the amount of screws that need to be removed differs from the amount in the figure above).
- Remove the metal back plate. Make sure that wires and flat foils are not damaged during plate removal.

Warning: make sure that the mains power is disconnected when you remove the metal back plate.

4.3 **Service Position Panels**

4.3.1 **SCAVIO Panel**

Solder-side SCAVIO

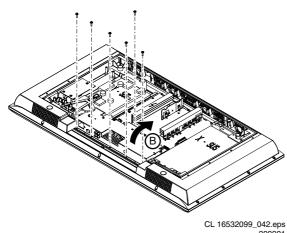

Figure 4-5 Service position SCAVIO (1)

To access the panel:

- 1. Remove the cables from connectors 0301, 0305, 0320, 0319, and 0388 to the SCAVIO panel.
- 2. Remove the power cable from the mains power inlet to the power supply (connector 0308).
- 3. Remove all screws at the bottom.
- 4. Hold the panel while removing the top screw, in order to prevent that the panel will drop.
- 5. Take the panel out, and turn it 180 degrees, so that you face the solder side of the SCAVIO panel.
- 6. Reconnect all cables. Use a standard power cable to connect the mains directly to PSU-connector 0308, and use the 'LED/Switch panel' service kit 3122 785 90410 (as the original cable is too short).

Caution: When measuring, watch out for the 'hot' left heat sink of the PSU!

Another way to measure the SCAVIO panel:

- 1. Remove all screws at the bottom.
- Hold the panel while removing the top screw, in order to prevent that the panel will drop.
- Put a piece of paper (or cardboard) in front of the Power Supply.
- Take the panel out, and turn it upward [B], so that you face the solder-side of the SCAVIO panel.

Caution: Make sure that the metal connector plate does not touch any 'hot' part of the Power Supply (heatsink).

Component-side SCAVIO

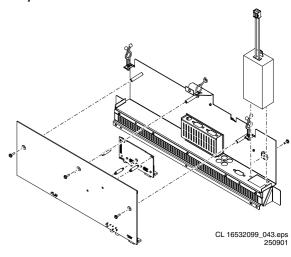

Figure 4-6 Service position SCAVIO (2)

To access the other side of the SCAVIO panel:

- 1. Disconnect all cables going to the SCAVIO panel.
- Remove all screws at the connectors of the connector plate, see figure 'Solder-side SCAVIO'.
- Remove all fixation screws that connect the SCAVIO panel to the connector plate, see figure 'Component-side SCAVIO'.
- Reconnect the SCAVIO panel, be careful: do not make a short-circuit!

4.3.2 VGA Connector Panel

To remove the VGA Connector Panel:

- 1. Squeeze the three plastic pins that connect this panel to the SCAVIO board, while you pull it carefully upwards.
- 2. Unplug the flat cable.

4.3.3 Power Supply Panel

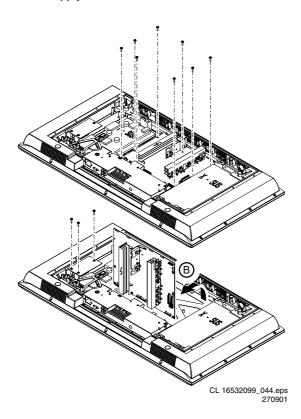

Figure 4-7 Service Position Power Supply

It is possible to perform most measurements from the component level side (thus, how the panel is mounted in the set). However, to reach the copper-side of the Power Supply:

- 1. Unplug the power.
- 2. Remove all fixation screws from the Power Supply.
- Hinge the Power Supply forward, so that you can reach the copper-side. Use a non-conducting part underneath, to support the PWB (e.g. a carton box).

Caution: make sure that, when you hinge the Power Supply forward, you do not damage the cables. Pay special attention to the flat cable (on connector 0307) and the cable on connector 0306, because they can be easily damaged by the sharp edge of the connector plate.

- 4. To remove the Power Supply, unplug all cables.
- 5. Remove the Power Supply.

4.3.4 Audio Amplifier Panel

The solder-side of this panel is directly accessible. To access the component-side, or to remove the whole panel, unscrew the three fixation screws (see figure 'Power Supply Panel'), and (re)move the panel.

4.4 PDP and Glass Plate Replacement

4.3.5 LED/Switch Panel and Speakers

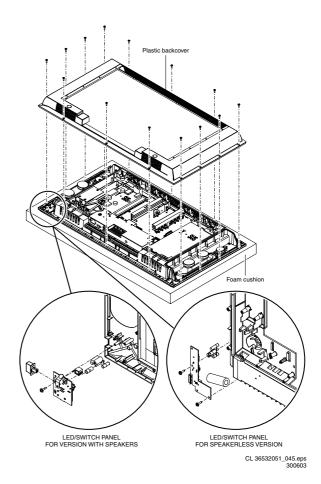

Figure 4-8 Service Position LED/Switch Panel and Speakers

To access or replace the LED/Switch panel and/or speakers:

- Take the monitor from its service stand, and put it (face down) on a soft surface (blanket, foam cushion or foam stand), to make sure that you do not damage the front glass plate.
- 2. Unscrew all fixation screws of the plastic back cover.
- 3. Lift and remove the plastic back cover.
- You can access now the LED/Switch panel and/or the speakers.

4.3.6 LED/Switch panel

To measure the component-side, or to remove the LED/Switch panel, unscrew one fixation screw (see enlarged part of figure 'LED/Switch Panel and Speakers'), and remove the panel.

4.3.7 Loudspeakers

As soon as you have removed the plastic back cover, you must replace the speaker-box sealing foams (12nc: 3122 358 76221). This, to ensure that the loudspeakers are airtight. Do not stretch the foam during mounting. Pay special attention to the corners, to make sure that the foam is not stretched and that it is pushed in the corners.

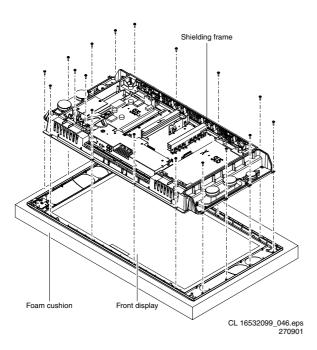

Figure 4-9 Exchanging the glass plate

Exchanging the glass plate

- 1. Take the monitor from its service stand, and put it (face down) on a soft surface (blanket, foam cushion or foam stand), to make sure that you do not damage the front glass plate.
- 2. Remove the metal back plate as described in paragraph 'Rear Cover Removal'.
- Unscrew all fixation screws of the plastic back cover.
- 4. Lift and remove the plastic back cover.
- 5. If the triangular shaped cable holder at the left bottom is present, unscrew the fixation screws of the holder at the left bottom, see figure 'Exchange Glass Plate'.
- 6. Unplug the cable of the LED/Switch panel, connector 0320
- 7. If the ESM Filter Panel at the left bottom is present, unscrew the fixation screws.
- 8. Unscrew all fixation screws of the (metallised) shielding frame, see figure 'Exchange Glass Plate'.
- 9. You can now remove the (metallised) shielding frame, together with the PDP, Audio panel, Power supply and SCAVIO panel attached to it, see figure 'Exchange Glass Plate'.

Note: To prevent scratches, make sure to put the shielding frame together with the PDP on a soft surface.

10. Replace the glass plate.

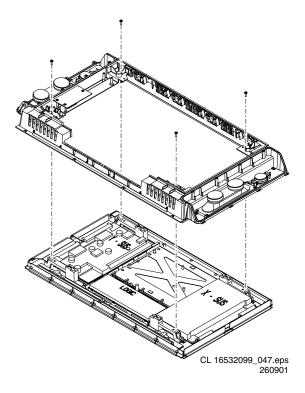

Figure 4-10 Exchanging the PDP

To exchange the PDP panel:

- 1. Take out the SCAVIO panel and Power Supply panel, as described earlier.
- 2. Unscrew all fixation screws of the (metallised) shielding frame (two at the top and two at the bottom, see figure 'Exchange PDP').
- The shielding frame can now be taken off the PDP.
- Replace the PDP.

4.5 Re-assembly

To re-assemble the whole set, do all processes in reverse order.

Notes:

- You must replace the speaker-box sealing foam, in case the plastic rear cover has been (re)moved.
- While re-assembling, make sure all the cables are in their original position and make sure all the EMC foams are present to ensure 'EMC tightness'.

Service Modes, Error Codes, and Fault Finding

Index of this chapter:

- Test points
- 2 Service Modes
- Problems and Solving Tips (related to CSM)
- 4 ComPair
- **Error Codes** 5
- The Blinking LED Procedure 6.
- 7. Protections
- 8. Repair Tips

5.1 **Test Points**

The chassis is equipped with test points (I- and F-points) printed on the circuit board assemblies. See test point overview in chapter 6.

Perform measurements under the following conditions:

- Service Default Mode.
- Video: colour bar signal (via PC or VGA-generator).
- Audio: 1 kHz, 2 V_pp (via PC or VGA-generator).

5.2 Service Modes

Service Default Mode (SDM) and Service Alignment Mode (SAM) offer several features for the service technician, while the Customer Service Mode (CSM) is used for communication between a Philips Customer Care Centre (P3C) and a customer.

There is also the option of using ComPair, a hardware interface between a computer (see requirements) and the FTV chassis. It offers the ability of structured troubleshooting, test pattern generation, error code reading, software version readout, and software upgrading.

Minimum requirements: a Pentium Processor, Windows 9x/NT/ 2000/XP, and a CD-ROM drive (see also paragraph 5.4).

Service Default Mode (SDM)

Purpose

- To create a pre-defined setting to get the same measurement results as given in this manual.
- To override SW protections (only when SDM is entered via the "service pins" on connector 0382).
- To start the blinking LED procedure.

Specifications

- All picture settings at 50% (brightness, contrast, etc.).
- Colour temperature is set to "normal".
- Bass, treble and balance at 50%; volume at 25%.
- All service-unfriendly modes (if present) are disabled, like:
- Video blanking,
- Slow de-mute,
- Anti ageing.
- Automatic switch to Standby when no sync signals are received.

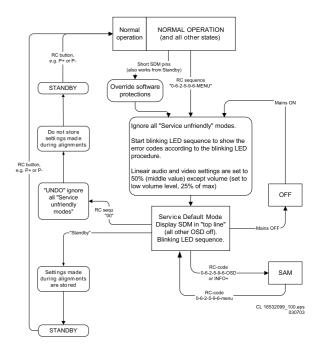

Figure 5-1 CL1SDM Flowchart

How to enter SDM

Use one of the following methods:

- Use the standard RC-transmitter and key in the code 062596, directly followed by the MENU button.
- Short jumpers 1 and 2 of connector 0382 on the SCAVIO panel.

After entering SDM, a blank screen is visible, with SDM in the upper left side for recognition. The Blinking LED procedure is started and will indicate any possible errors via the (orange) front LED.

How to navigate

To toggle to the SAM mode, use a standard customer RCtransmitter and key in the code 062596, directly followed by the OSD (i+) key.

How to exit

Use one of the following methods (the set returns to its last status):

- Switch the set to STANDBY by pressing the power button on the remote control transmitter (if you switch the set "off" by removing the Mains power, the set will return in SDM, when the Mains power is re-applied).
- Use the standard RC-transmitter and key in the code 00.

5.2.2 Service Alignment Mode (SAM)

Purpose

- To perform (software) alignments.
- Easy way to identify the commercial type number of the
- Easy identification of the used software versions.
- To display (or clear) the error code buffer.
- View operational hours.

Specifications

- Operation hours counter.
- Software version reading.
- Error buffer reading and erasing.
- Software alignments.
- Test pattern generation.

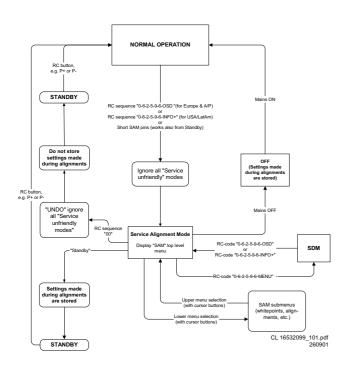

Figure 5-2 SAM Flowchart

How to enter

Use one of the following methods:

- Use a standard RC-transmitter and key in the code 062596 directly followed by the OSD (i+) button. Note: the OSD (i+) is not available on the original FTV remote control; therefore use another Philips remote control (e.g. MG, EMG or A10).
- Short jumpers 3 and 4 of connector 0382 on the SCAVIO panel.

The following screen is visible:

Table 5-1 SAM Menu "General"

Service Alignment Menu	General
Type Nr AG Code	32FD9944/01S (example)
SW Version OTC	AAAABC-X.Y_xxxxx
SW Version PW	AAAABC-X.Y_xxxxx
SW Version EPLD	AAAABC-X.Y_xxxxx
Errors 1	xx xx xx xx xx
Errors 2	xx xx xx xx xx
Operational hours	xx
Reset error buffer	Press OK to reset
Store	Press OK to store

- 1. TYPE NR. Gives the commercial type number of the monitor, e.g. 32FD9944/01S.
- AG CODE. Is not implemented.
- SW VERSION OTC (AAAABC-X.Y-xxxxx).

Note: You will find details of the latest software versions in the chapter "Software Survey" of the "Product Survey -Colour Television" publication, which is published four times each year.

- A = the chassis name (FM23 for all displays).
- B = the region (E= Europe, A= Asia Pacific, U= NAFTA, L= LATAM or G = Global).
- C = the configuration name (B= Basic, E= Enhanced).
- X = the main software version number.
- Y = the sub software version number.
- x = last five digits of 12nc code.
- 4. SW VERSION PW (AAAABC-X.Y-xxxxx). See description above.

- 5. SW VERSION EPLD (AAAABC-X.Y-xxxxx). See description above.
- **ERRORS 1.** Gives the last five errors of the error buffer. The last detected error is displayed at the most left position. The errors are displayed as 2 digit numbers and separated by a space. When less than 10 errors occurred, the rest of the line(s) is empty. In case of no errors, the text "No Errors" is displayed behind menu item "Errors 1". See paragraph 5.5 for a description.
- 7. ERRORS 2. Gives the first five errors of the error buffer. The last detected error is displayed at the most left position.
- **OPERATIONAL HOURS.** The Operations Hours indicate the time that the display was active with half an hour resolution. It represents the system hours (OTC), not the PDP hours.
- RESET ERROR BUFFER. Erase the contents of the error buffer. Press "OK" on your remote control to activate. The content of the error buffer is cleared.
- 10. STORE. This will store the performed alignments. Press "OK" on your remote control to activate.

Note: if you do not want to store the performed alignments, leave the SAM mode via code 0 0 on your remote control. Do not activate the "store" item.

How to navigate

Use one of the following methods:

- Select the sub-menu's (upper line) with the CURSOR LEFT/RIGHT keys on the remote control transmitter.
- Select the menu items with the CURSOR UP/DOWN keys. With the CURSOR LEFT/RIGHT keys it is possible to:
 - Activate the selected menu item.
 - Change the value of the selected menu item.
- To toggle to the SDM mode, use the standard customer RC-transmitter and key in the code 062596, directly followed by the MENU key.

How to exit

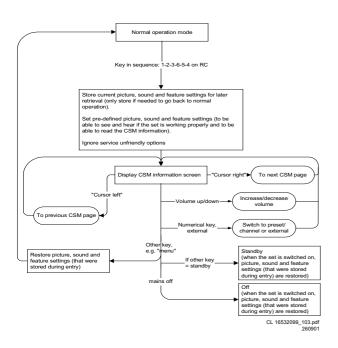

Use one of the following methods:

- Switch the set "off" (with the Mains switch or by pulling the
 - Note: new alignment settings are always stored, even when item "store" was not activated!
- Switch the set to "standby" by pressing the power button on the remote control transmitter.
 - Note: new alignment settings are always stored, even when item "store" was not activated!
- Use the standard RC-transmitter and key in the code 00. Note: new alignment settings are not stored (except when item "store" was activated)!

Customer Service Mode (CSM)

When a customer is having problems with his TV-set, he can call his dealer or helpdesk. The service technician can than ask the customer to activate the CSM, in order to identify the status of the set. Now, the service technician can judge the severness of the complaint. In many cases, he can advise the customer how to solve the problem, or he can decide if it is necessary to visit the customer.

The CSM is a read only mode; therefore, modifications in this mode are not possible.

FM23, FM24, FM33

Figure 5-3 CSM Flowchart

How to enter

Use the standard customer RC-transmitter and key in the code 123654.

When CSM is entered, the values of brightness, contrast, etc. are set to 50% (of max. value), and volume is set to 25%, to ensure that you always have a picture and sound.

After switching "on" the Customer Service Mode, the following screen will appear:

Table 5-2 CSM Menu

Customer Service Menu 1	
1 - Type Nr AG Code	32FD9944/01S-AG02 (example)

11 - Tint	xx
12 - Sharpness	xx
13 - Soundmode	xx
14 - Source	xx
15 - AV Mute	xx

- 1. TYPE NR. AG CODE. Gives the commercial type number of the monitor, e.g. xxFD9954/01S. The AG CODE is not implemented.
- **SW VERSION OTC** (AAAABC-X.Y-xxxxx)

Note: You will find details of the latest software versions in the chapter "Software Survey" of the "Product Survey -

Colour Television" publication, which is published four times each year.

- A = the chassis name (FM23 for all displays).
- B = the region (E= Europe, A= Asia Pacific, U= NAFTA, L= LATAM or G = Global).
- C = the configuration name (B= Basic, E= Enhanced).
- X = the main software version number.
- Y = the sub software version number.
- x = last five digits of 12nc code.
- 3. SW VERSION PW (AAAABC-X.Y-xxxxx). See description above.
- SW VERSION EPLD (AAAABC-X.Y-xxxxx). See description above.
- 5. CODE 1. Gives the last five errors of the error buffer. The last detected error is displayed at the most left position. The errors are displayed as 2 digit numbers and separated by a space. When less than 10 errors occurred, the rest of the line(s) is empty. In case of no errors, the text NO ERRORS is displayed behind menu item CODE 1. See paragraph "Error Buffer" for a description.
- 6. CODE 2. Gives the first five errors of the error buffer. The last detected error is displayed at the most left position.
- 7. VOLUME. Gives the last volume status for the selected source, as set by the customer.
- 8. BRIGHTNESS. Gives the last brightness status for the selected source, as set by the customer.
- CONTRAST. Gives the last contrast status for the selected source, as set by the customer.
- 10. COLOR (not present in Basic configuration). Gives the last colour status for the selected source, as set by the customer.
- 11. TINT (only for NTSC Enhanced configuration). Gives the last tint status for the selected source, as set by the customer.
- 12. SHARPNESS. Gives the last sharpness status for the selected source, as set by the customer.
- 13. SOUND MODE. Gives the selected sound mode, as set by the customer.
- 14. SOURCE. Gives the selected source, as set by the customer.
- 15. AV MUTE. Indicates if AV Mute is "on" or "off".

How to navigate

Use one of the following methods:

- Switch to the other CSM page with the "cursor left/right" keys on the remote control.
- You can increase/decrease volume with the "volume up/ down" keys on the remote control.
- You can switch to another source with the "num / ext" keys on the remote control.

How to exit

Use one of the following methods:

- Press the MENU key of the remote control transmitter.
- Switch the set to "standby" with the Power switch on the remote control.
- Switch the set "off" with the Mains power switch on the set.

5.3 Problems and Solving Tips (Related to CSM)

Picture Problems 5.3.1

Note: Below described problems are all related to the monitor settings. The procedures to change the value (or status) of the different settings are described.

Picture too dark or too bright

Increase/decrease the "brightness" and/or the "contrast" value when the picture improves after you have switched on the Customer Service Mode. The new value is automatically stored.

White line around picture elements and text

Decrease the "sharpness" value when the picture improves after you have switched on the Customer Service Mode. The new value is automatically stored.

Snowy picture and/or unstable picture

A scrambled or decoded signal is received.

Black and white picture

Increase the "colour" value when the picture improves after you have switched on the Customer Service Mode. The new value is automatically stored.

Menu text not sharp enough

Decrease the "contrast" value when the picture improves after you have switched on the Customer Service Mode. The new value is automatically stored.

5.3.2 Sound Problems

No sound from left or right speaker

Check item VOLUME in the CSM mode. If value is low, increase the volume level. The new value is automatically stored.

No sound or sound too loud (after channel change/

Increase/decrease the "volume" level when the volume is OK after you switched on the CSM. The new value is automatically stored.

5.4 ComPair

5.4.1 Introduction

ComPair (Computer Aided Repair) is a service tool for Philips Consumer Electronics products. ComPair is a further development on the European DST (Dealer Service Tool), which allows faster and more accurate diagnostics. ComPair has three big advantages:

- ComPair helps you to quickly get an understanding on how to repair the chassis in a short time by guiding you systematically through the repair procedures.
- ComPair allows very detailed diagnostics (on I2C level) and is therefore capable of accurately indicating problem areas. You do not have to know anything about I2C commands yourself because ComPair takes care of this.
- ComPair speeds up the repair time since it can automatically communicate with the chassis (when the microprocessor is working) and all repair information is directly available. When ComPair is installed together with the SearchMan electronic manual of the defective chassis, schematics and PWBs are only a mouse click away.

5.4.2 Specifications

ComPair consists of a Windows based faultfinding program, and an RS232 cable between PC and the (defective) product.

The ComPair faultfinding program is able to determine the problem of the defective monitor. ComPair can gather diagnostic information in two ways:

- Automatic (by communication with the monitor): ComPair can automatically read out the contents of the entire error buffer. Diagnosis is done on I2C level. ComPair can send and receive commands to the micro controller of the monitor, and so can access the I2C bus of the monitor. In this way, it is possible for ComPair to communicate (read and write) to devices on the I2C busses of the FTV monitor.
- Manually (by asking questions to you): Automatic diagnosis is only possible if the micro controller of the monitor is working correctly and only to a certain extend.

When this is not the case, ComPair will guide you through the faultfinding tree by asking you questions (e.g. Does the screen give a picture? Click on the correct answer: YES / NO) and showing you examples (e.g. Measure test-point F7 and click on the correct oscillogram you see on the oscilloscope). You can answer by clicking on a link (e.g. text or a waveform picture) that will bring you to the next step in the faultfinding process.

By a combination of automatic diagnostics and an interactive question / answer procedure, ComPair will enable you to find most problems in a fast and effective way.

Beside fault finding, ComPair provides some additional features like:

- Software upgrading (upload possible to OTC and PW Scaler).
- Emulation of the (European) Dealer Service Tool (DST).
- If both ComPair and SearchMan (Electronic Service Manual) are installed, all the schematics and the PWBs of the set are available by clicking on the appropriate hyperlink.

Example: Measure the DC-voltage on capacitor C2228 (Schematic/Panel) of the SCAVIO panel. Click on the "Panel" hyperlink to automatically show the PWB with a highlighted capacitor C2568. Click on the "Schematic" hyperlink to automatically show the position of the highlighted capacitor.

5.4.3 How to Connect

- 1. First, install the ComPair Browser software on your PC (read the installation instructions carefully).
- 2. Connect an RS232 interface cable between a free serial (COM) port on your PC and the RS232 connector on the plasma monitor.
- Switch the plasma monitor "off" and "on" again (with the Mains switch).
- 4. Start the ComPair program and follow the instructions.

Note: once the set is in ComPair mode, the front LED will blink red, at a frequency of 0.3 Hz.

5.4.4 How to Order

ComPair order codes:

- Starter kit ComPair32 software (registration version): 3122 785 60040.
- Starter kit SearchMan32 software: 3122 785 60050.
- ComPair32 CD (update): 3122 785 60070.
- SearchMan32 CD (update): 3122 785 60080 (year 2002), 3122 785 60120 (year 2003). If you encounter any problems, contact your local support desk.

Note: The RS232 cable is not included. It is a standard cable (9p sub-D male-to-female) that can be obtained by a computer store. It is supplied however with the ComPair interface (4822 727 21631), necessary for servicing other Philips TVs.

5.5 **Error Buffer**

The error code buffer contains all detected errors since the last time the buffer was erased. The buffer is written from left to right. When an error occurs that is not yet in the error code buffer, it is written at the left side and all other errors shift one position to the right.

5.5.1 How to Read the Error Buffer

Use one of the following methods:

- On screen via the SAM (only if you have a picture).
 - Errors: 6 0 0 0 0, error code 6 is the last and only detected error.

- Errors: 9 6 0 0 0, error code 6 was first detected and error code 9 is the last detected (newest) error.
- Via the blinking LED procedure (when you have no picture). See paragraph "The Blinking LED Procedure".
- Via ComPair.

- By activation of the RESET ERROR BUFFER command in the SAM menu.
- When you transmit the code 062599 with a standard remote control transmitter.

How to Clear the Error Buffer 5.5.2

The error code buffer is cleared in the following cases:

5.5.3 **Error Codes**

Table 5-3 Error code overview

Error	Device	Description	Item	Diagr.
1	TEA6422D	Audio switch (only Enhanced)	7798	SC13
2	MSP3451G	Sound processor		SC14
3	PCF8574-SCAVIO	I/O expander SCAVIO	7540	SC8
4	PCF8591	AD-DA expander	7530	SC8
5	FS6377	Clock generator	7570	SC9
6	PCF8574-PSU	I/O expander PSU	7370	P3
7	24C16 OTC	NVM OTC	7430	SC7
8	24C16 PW	NVM PW	7580	SC9
9	SAA7118	Video decoder (only Enhanced)	7225	SC5
10	AD9887	ADC/TMDS receiver	7170	SC4
11	SDA9400	De-interlacer (only Enhanced)	7280	SC5
12	EP1K30QC	EPLD processor	7656	SC11
13	PDP	Display I2C error		
14	PDP H2-version (FHP)	The "high brightness" mode (only for H2) does not function		
15	LM75A	Temperature sensor I2C error (only for 37-inch)	7372	P3
20	Download comm.	Errors during downloading		
21	CSP comm.	CSP time-out error		
30	PDP	Display HW error		
31	PDP	Display warning code (e.g. loose connector or defective PSU)		
40	Temperature alarm	Detection of over-temperature		
70	V_s overvoltage	Overvoltage on V_s, V_a, +3V3, +5V or a combination	7341	P3
71	V_s undervoltage	Undervoltage on V_s	7308A/B	P3
72	V_a undervoltage	Undervoltage on V_a	7308C/D	P3
73	+5V undervoltage	Undervoltage on +5V	7330A/B	P3
74	+3V3 undervoltage	Undervoltage on +3V3	7330C/D	P3
75	DC-PROT	Audio amplifier protection	7362	P3
76	TEMP-PSU	Over-temperature in PSU	7366A	P3
77	Protection with reason unknown	No valid protection can be read, but protection is active (PSU)		
78	Protection after several retries	PW Scaler will not start comm. with OTC after several retries		
9x	ОТС	Internal OTC error (replace OTC)	7383	SC7

Notes:

- In case of non-intermittent faults, clear the error buffer before you begin the repair. This to ensure that old error codes are no longer present.
- If possible, check the entire contents of the error buffer. In some situations, an error code is only the result of another error code and not the actual cause (e.g., a fault in the protection detection circuitry can also lead to a protection).

5.6 The Blinking LED Procedure

Via this procedure, you can make the contents of the error buffer visible via the front LED (orange colour). This is

especially useful when there is no picture. When no errors are present, the LED will stay green.

When the SDM is entered, or when code 062500 is entered with the remote control, the LED will blink the contents of the error-buffer.

Error-codes ≥ 10 are shown as follows:

- 1. "n" long blinks of 750 ms, which is/are an indication of the decimal digit,
- 2. a pause of 1.5 s,
- 3. "n" short blinks (n = 1-9),
- when all the error-codes are displayed, the sequence finishes with a LED blink of 3 s,
- 5. the sequence starts again.

Example of error buffer: 12 9 6 0 0

After entering SDM:

- 1. 1 long blink of 750 ms followed by a pause of 1.5 s,
- 2 short blinks followed by a pause of 3 s,
- 3. 9 short blinks followed by a pause of 3 s,
- 4. 6 short blinks followed by a pause of 3 s,
- 5. 1 long blink of 3 s to finish the sequence,
- 6. the sequence starts again.

5.7 **Protections**

You can read the error codes of the error buffer via the service menu (SAM), the blinking LED procedure, or via ComPair. If a fault situation is detected an error code will be generated and if necessary, the set will be put in the protection mode. Blinking of the red LED at a frequency of 5 Hz indicates the protection

In some error cases, the microprocessor does not put the set in the protection mode. The error codes are indicated by an orange front LED.

To get a quick diagnosis the chassis has three service modes implemented:

- The Customer Service Mode (CSM): easy way to read out the status of the set.
- The Service Default Mode (SDM): start-up of the set in a predefined way.
- The Service Alignment Mode (SAM): adjustment of the set via a menu and with the help of test patterns.

5.8 **Repair Tips**

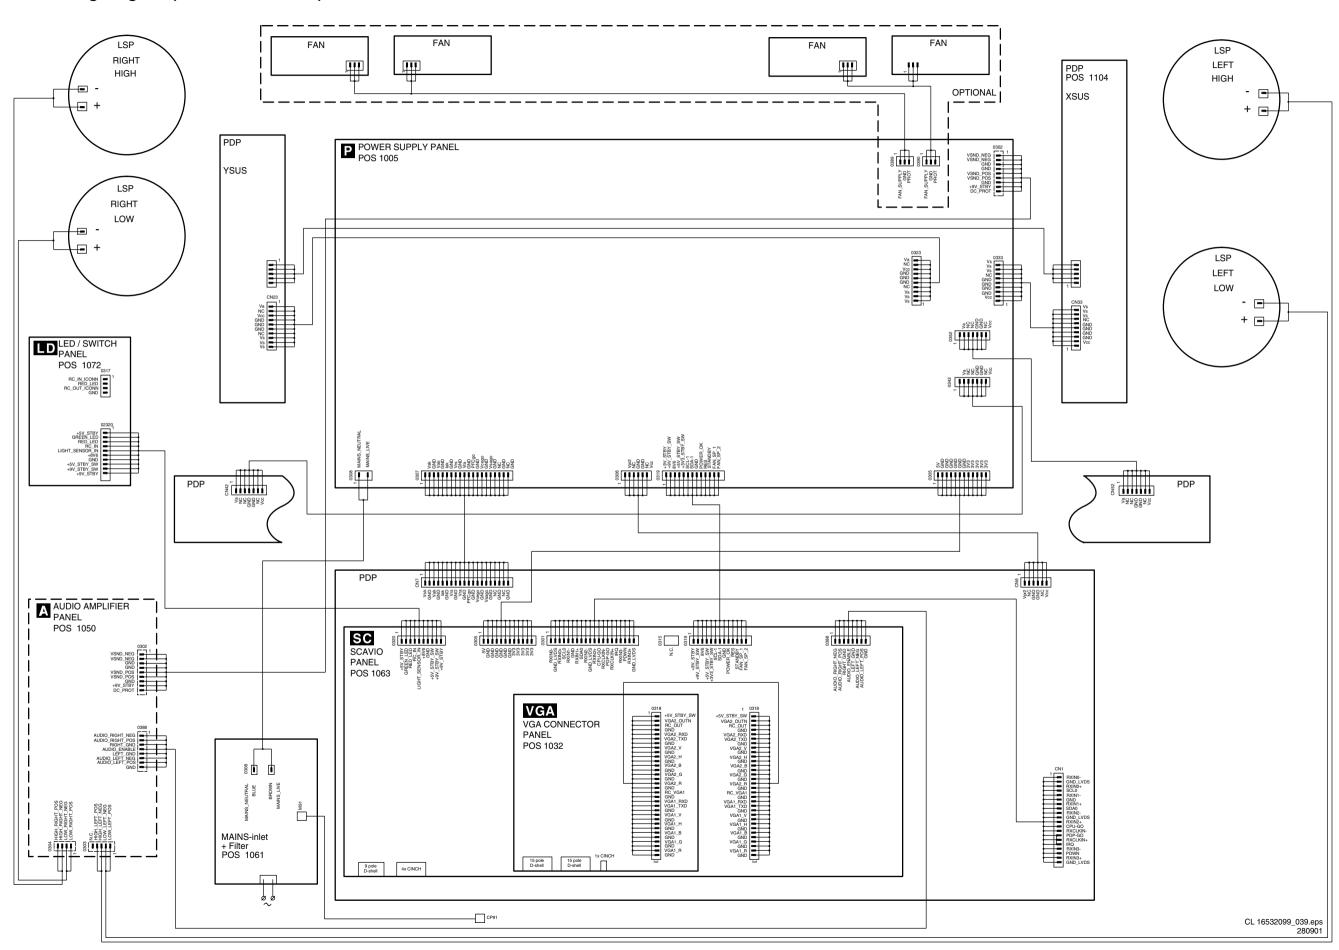

Below some failure symptoms are given, followed by a repair

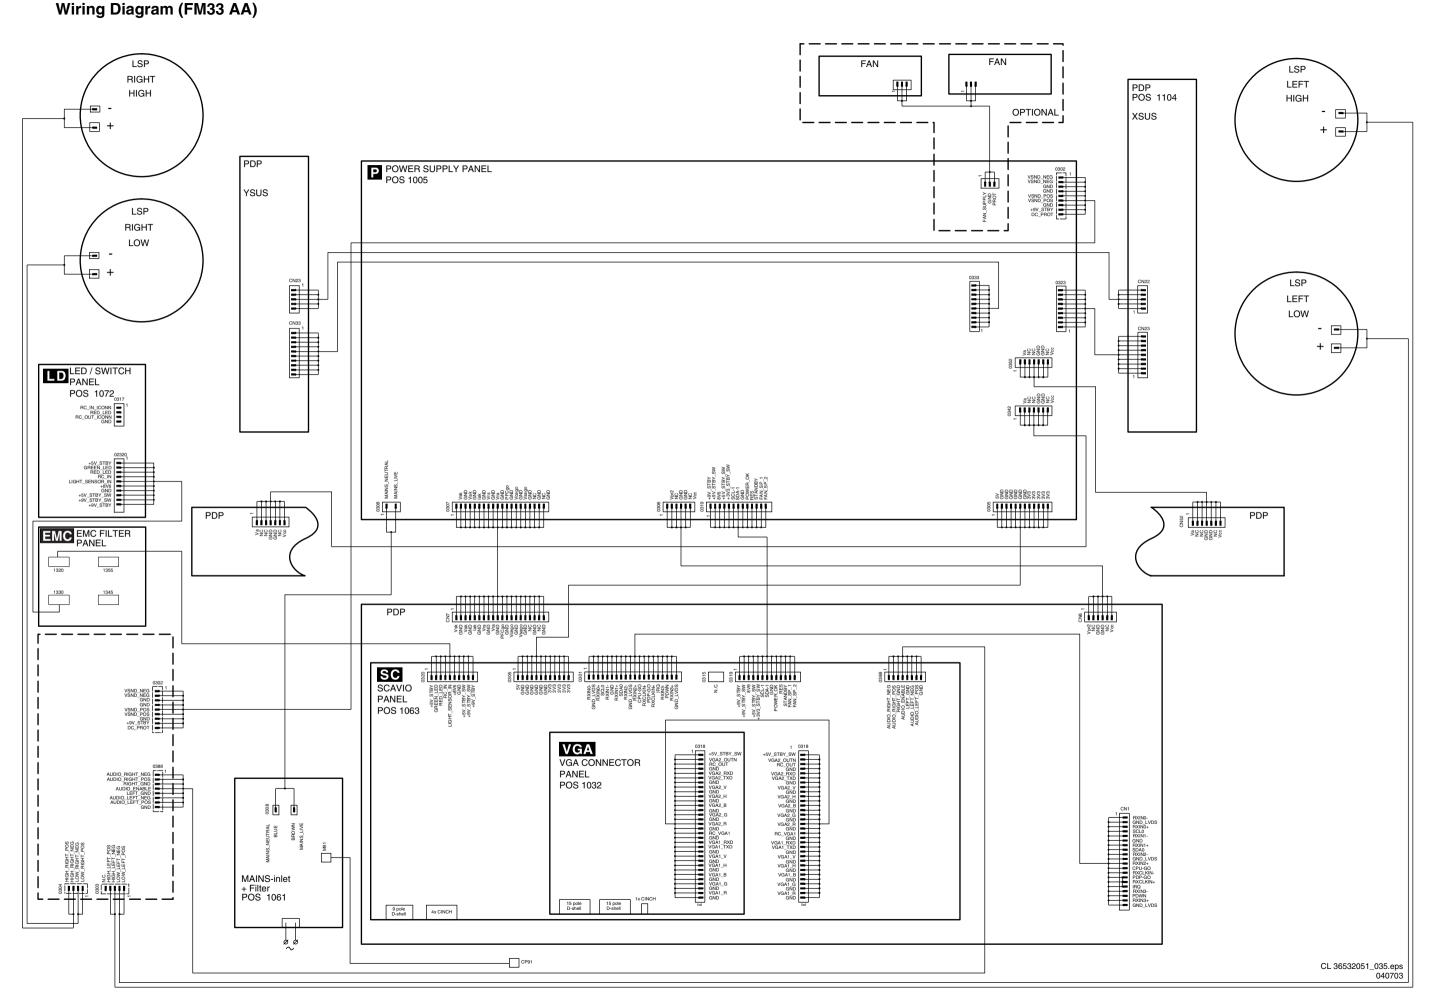

- Error code indicates an under- or over voltage protection (errors 70 - 74). Possible causes:
 - A short-circuit present on PSU.
 - A short-circuit present in PSU load circuit.
 - The converter is not functioning (no start-up, or non short-circuit failure).
- Set starts up, but switches "off" soon.
 - 1. Check the PSU outputs. If no output at all, verify the Power Factor Corrector (= PFC or pre-conditioner) e.g. the relays. When PFC is not switching, the LLC is actively held "off".
 - 2. If the PFC works, check the V_cego.
 - 3. If V_cego is high, check V_s on the LLC (Vs_unsw).
 - 4. If there is no V_s, check pin 15.
 - 5. If the voltage is OK, check pins 12 and 14.
 - If there are no pulses, check controller pin 10.
 - 7. If pin 10 < 1 V, the IC is probably defect.
- If fuse 1004 (diagram P6) is blown. Check items 7005 and 7006. If one of them is defect, replace both!
- If fuse 1400 (diagram P2) is blown. Check diode bridge 6600, diodes 6605 and 6606, and MOSFET 7610 (diagram P5)
- The set does not react on the Remote Control Transmitter. If the monitor is set (by accident or deliberate) in ICONN-mode (via SAM - Options), and there is no ICONN-Box connected, the RC-signal line to the OTC is interrupted. This can be solved by connecting pin 8 and 9 of the RS232 connector at the rear of the monitor.

- Hardware Alignments
- Software Alignments and Settings

Note: The Service Default Mode (SDM) and Service Alignment Mode (SAM) are described in chapter 5. Menu navigation is done with the "CURSOR UP, DOWN, LEFT, OR RIGHT" keys of the remote control transmitter.

8.1 **General Alignment Conditions**

Perform all electrical adjustments under the following conditions:

Mains voltage and frequency: 220 V_ac / 50 Hz unless otherwise stated.

Connect the set to the Mains via an isolation transformer. Allow the set to warm up for approximately 20 minutes. Measure the voltages and waveforms in relation to chassis ground (with the exception of the voltages on the primary side of the power supply). Never use the cooling fins/plates as

Test probe: Ri > 10 Mohm, Ci < 2.5 pF.

Use an isolated trimmer/screwdriver to perform the alignments.

Use a VGA-generator (e.g. Astro) or a Personal Computer (*) as test pattern generator (contact your National Service Organisation for the necessary PC test pattern files) and connect it to the VGA1 input of the plasma monitor. When you use a PC, start Microsoft PowerPoint (or Paintbrush), and load the mentioned file. Then display the picture as full screen.

(*) If you use a PC as generator, please check (measure) if the video output signals fulfil the VGA standards (see chapter 1).

8.2 **Hardware Alignments**

There are no hardware alignments necessary.

8.3 **Software Alignments**

Enter the Service Alignment Mode (see chapter 5). The SAM menu will now appear on the screen.

Select one of the following alignment menus via the upper horizontal bar:

- 1. GENERAL (GEN.)
- 2. DISPLAY (DISP.)
- 3. SCALER (SCAL.)
- 4. VIDEO 1 (VID.1)
- 5. VIDEO 2 (VID.2)
- 6. OPTIONS (OPT.)

The last three items are not available in the Basic configuration.

Note: There are several methods to exit the SAM, each with its own characteristics:

- Switch the set "off" (with the Mains switch or by pulling the Mains cord); new alignment settings are always stored, even when item "store" was not activated!
- Switch the set to "standby" by pressing the power button on the remote control transmitter; new alignment settings are always stored, even when item "store" was not activated!
- Use a standard RC-transmitter and key in the code 00; new alignment settings are not stored, except when item "store" was activated!

8.3.1 GENERAL

Table 8-1 SAM Menu "GEN."

Press OK to reset
Press OK to store

This menu is fully explained in chapter 5.

STORE

Select this item, and press OK, to store the alignments.

8.3.2 DISPLAY

Table 8-2 SAM Menu "DISP."

Service Alignment Menu	Display (Disp.)
Test pattern	On / Off
Contrast	Adjust
Gamma	Adjust
White point	Adjust
Compensation fact.	0 <> 255 128

TEST PATTERN

Possible to generate an "even white" test pattern, which is generated by the PDP. You can use this picture, to check the plasma display for pixel defects.

CONTRAST

Not necessary to align, fixed value is "255".

GAMMA

Not necessary to align, fixed value is "2".

Not necessary to align, unless stated by the NSO. Fixed value is "255".

COMPENSATION FACTOR

Not necessary to change. Fixed value is "128". In some cases however, a new software table must be loaded in the Pixel Works Scaler (via ComPair). The following service scenarios are possible:

- When a defective glass filter plate is replaced: This requires a new "White Point" adjustment (see next
- When a defective PDP is replaced by the same type: This requires a new "White Point" adjustment (see next paragraph).
- When a defective PDP is replaced by another (newer) type: This requires both a new compensation table upload (by ComPair), and a new "White Point" adjustment (see next paragraph). Note: The loaded software, performs the settings automatically.
- When a new software table must be loaded in the Pixel Works Scaler (e.g. in case of a software update): This requires both a new compensation table upload (by

ComPair), and a new "White Point" adjustment (see next paragraph).

Note: The loaded software, performs the settings automatically.

8.3.3 **SCALER**

Table 8-3 SAM Menu "SCAL."

Service Alignment Menu	Scaler (Scal.)
Test pattern	On / Off
Color temperature	6500K / 8700K / 10000K
White point	Adjust
Align ADC	Press OK to execute
Clear user settings	Press OK to clear

TEST PATTERN

This function makes it possible to generate a "colour bar" test pattern (generated by the PW Scaler IC). You can use this picture, to check the video path, starting at the PW Scaler IC to the plasma display.

COLOUR TEMPERATURE

Select the appropriate colour temperature for the alignments (see also "White point" adjustment below).

WHITE POINT

Table 8-4 SAM Menu "SCALER - WHITE POINT"

Service Alignment Menu	Scaler - White point
White point red	<> 125
White point green	<> 100
White point blue	<> 110
Press OK when done	

Notes:

- First align the ADC (see ALIGN ADC) before aligning the WHITE POINT.
- The alignment values should NOT exceed the value "128".

Method 1 (with colour analyser)

Supply, via an external VGA source (e.g. a VGA generator, or a PC in 640x480 mode), a "White Drive" test pattern (ask your NSO for the PC file). This picture consists of black picture (0 mV) with in the middle a 100% white (0.7 V) square with dimensions 202x152.

- 1. Set "Brightness" to "50" and "Contrast" to "71" (via the standard customer menu).
- Go to the SAM menu.
- Set COLOR TEMPERATURE to "8700 K" (with the introduction of the high brightness H2 plasma panels, the "NORMAL" colour temperature is adapted from "7600 K" to
- 4. Measure with a CTV colour analyser (calibrated with the spectra) on the centre of the white square on the screen.
- 5. Select WHITE POINT in the SAM SCALER menu, and press CURSOR RIGHT.
- 6. Adjust with the CURSOR UP/DOWN or LEFT/RIGHT command, the three WHITE POINTS RED, GREEN and BLUE to "128" (do not go above this value!), and align with one or two of the drivers to the correct coordinates (see
- Repeat the same measurement for respectively colour temperature "6500 K" and "10000 K".
- Repeat again if necessary.

Table 8-5 White Point XY-coordinates

Colour Temperature	Х	У
6500 K (Cool)	313	329
8700 K (Normal)	289	299
10000 K (Warm)	280	289

Method 2 (without colour analyser)

Without having a CTV colour analyser, it is possible to directly set some parameters, which are based on average values from production.

Table 8-6 White point RGB-values 32-inch monitor

Col. Temp. 32"	R	G	В
6500 K (Cool)	114	125	128
8700 K (Normal)	119	128	128
10000 K (Warm)	125	128	115

Table 8-7 White point RGB-values 37-inch monitor

Col. Temp. 37"	R	G	В
6500 K (Cool)	112	128	127
8700 K (Normal)	117	128	124
10000 K (Warm)	119	128	111

Table 8-8 White point RGB-values 42-inch monitor

Col. Temp. 42"	R	G	В
6500 K (Cool)	116	126	128
8700 K (Normal)	119	128	125
10000 K (Warm)	127	127	112

ALIGN ADC

Supply, via an external VGA source (e.g. a PC, mode 640x480), the "ADC alignment" test pattern (ask your NSO for

The upper 360 lines of this picture consists of a half black and half white picture with the following settings (on a full scale of

- Black "17" (47 mV).
- White "255" (700 mV).

The lower 120 lines of this picture, are vertically divided into 4 boxes of 160 pixels each with (from left to right) the following settings:

- Black "0" (0 mV).
- Black "5" (14 mV).
- White "250" (686 mV). White "255" (700 mV).
- Go to the SAM menu.
- Select ALIGN ADC in the SAM Scaler menu, and press CURSOR RIGHT.
- 3. The alignment is performed automatically.

CLEAR USER SETTINGS

In some (rare) cases it is possible that the PW Scaler recalls settings, which are made earlier by the user (e.g. "phase" or "shift"), and not the last (wanted) settings. To correct this problem, one can select this function.

8.3.4 VIDEO 1 (Enhanced version only)

Table 8-9 SAM Menu "VID. 1"

Service Alignment Menu	Video 1 (Vid. 1)
Test pattern	On / Off
Brightness	0 <> 255
Contrast	0 <> 255
Sharpness	0 <> 255

TEST PATTERN

This function makes it possible to generate a "full white" test pattern (generated by the de-interlacer SDA9400, item 7280). You can use this picture, to check the video path of the external inputs AV1, AV2, and AV3, starting at item 7280 (mind you: the proper functioning of the Digital Video Decoder SAA7118 is not tested!).

Note: To generate the test pattern, it is necessary to feed a signal to one of the AV-inputs.

BRIGHTNESS

This is the setting of IC7225 (SAA7118). Not necessary to align, fixed value is:

- "132" for PAL/SECAM.
- "139" for NTSC.

CONTRAST

This is the setting of IC7225 (SAA7118). Not necessary to align, fixed value is:

- "139" for PAL/SECAM.
- "128" for NTSC.

SHARPNESS

Not necessary to align, fixed value is "6".

8.3.5 VIDEO 2 (Enhanced version only)

Table 8-10 SAM Menu "VID. 2"

Service Alignment Menu	Video 2 (Vid. 2)	
,	0 <> 7	
-	0 <> 7	
Lum. delay NTSC	0 <> 7	

With these alignments, you can place the luminance information on the chrominance information (push brightness onto the colour). Use a colour bar/grey scale pattern as test signal. These values are normally fixed.

LUM. DELAY PAL

Apply a PAL colour bar/grey scale pattern as a test signal. Adjust value until the transients of the colour part and black and white part of the test pattern are at the same position. Fixed value is "4".

LUM. DELAY SECAM

Apply a SECAM colour bar/grey scale pattern as a test signal. Adjust value until the transients of the colour part and black and white part of the test pattern are at the same position. Fixed value is "4".

LUM. DELAY NTSC

Apply a NTSC colour bar/grey scale pattern as a test signal. Adjust value until the transients of the colour and black & white part of the test area are at the same position. Fixed value is "4".

8.3.6 OPTIONS (Enhanced version only)

Table 8-11 SAM Menu "OPT."

Service Alignment Menu	Options (Opt.)
Vs/Va control	On / Off
Display size	32" / 42"
Virgin	On / Off
ICONN control	On / Off
FAN control	On / Off

Vs/Va CONTROL

When this option is set to "on", it will enable the "PDP feedback loop" for the automatic V_s and V_a alignment. See table below for the correct setting.

Table 8-12 V_s/V_a Control options

	PSU version 3	PSU v.3 with precision R's	
PDP with Vs feedback	Feedback loop	Feedback loop 'ON', but align-	
(-52 PDP)		ment (check)	•
	Feedback loop		
	'OFF', align-		•
(with 'B' in se-	ment is necessary.	ment (check) necessary.	necessary.

DISPLAY SIZE

This option is only meant for the factory, to indicate the display size for the software.

Note: When none of the items is highlighted, the 37-inch display is selected.

Normally "off". When this option is set to "on", the display starts with the language selection menu.

ICONN CONTROL

Normally "off". Set this option to "on" in case a so-called "ICONN"-box (for Hotel TV) is connected to the display. Caution: When this option is set to "on", without an ICONN-

Box connected to the monitor, one cannot control the monitor anymore (because the RC connection is interrupted). There are two ways to restore the remote control again: Connect pin 8 (IR_TX) to pin 9 (IR_RX) on the RS232

connector of the monitor (the easiest way to do this, is to make a "dummy" connector with these pins connected, and plug this into the monitor), or

Set the set in the Service Alignment Mode (SAM) via shorting jumpers 1 and 2 of connector 0382 on the SCAVIO panel. After this, you can enter the appropriate menu to set ICONN CONTROL to "off" again.

FAN CONTROL

Normally "off". Set this option to "on", when the optional fans are mounted (ask your NSO for info).

Circuit Descriptions, List of Abbreviations, and IC Data Sheets

Index of this chapter:

- 3. VGA connector Panel
- 4 **SCAVIO Panel**
- **Audio Amplifier Panel**
- LED/Switch Panel 6
- 7. Plasma Display Panel
- 8. Abbreviations
- 9. IC Data Sheets

Notes:

- Figures can deviate slightly from the actual situation, due to different set executions.
- For a good understanding of the following circuit descriptions, please use the diagrams in chapter 6 and 7. Where necessary, you will find a separate drawing for clarification.

9.1 Introduction

The FM-chassis is the 3rd generation Philips plasma monitors. In comparison to the FTV1.9DE, it has:

- A power supply that is based on the MG-chassis,
- A new SCAVIO panel, which takes over the tasks of the former AVC and LIMESCO panels.
- A new, class-D, audio amplifier,

A new, improved, Plasma Display Panel (with new ALiS technology).

It is possible to use this product as stand-alone monitor or, in combination with the so-called F21RE Receiver box, for TV applications.

In this manual, we combined three screen sizes (32-inch as FM23, 37-inch as FM33, and 42-inch as FM24) into one manual. When there are important differences between these versions, this is explicitly mentioned.

For these chassis, there are two configurations:

- Basic: which has one video input (VGA1) and one video output (VGA2). The VGA2 video output is directly connected to the VGA1 video input, without any processing. The audio output of VGA2 is also directly connected to the VGA1 audio input.
- Enhanced: which has six video inputs (VGA1, VGA2, DVI-D, CVBS, YC and HD) and six corresponding audio inputs. These inputs are internally converted to the appropriate signals. The VGA2 connection is here bi-directional (Flex-VGA).

Note: In all descriptions below, the Enhanced version of this FM-chassis is discussed. When there are important differences between the Basic and Enhanced versions, this is mentioned.

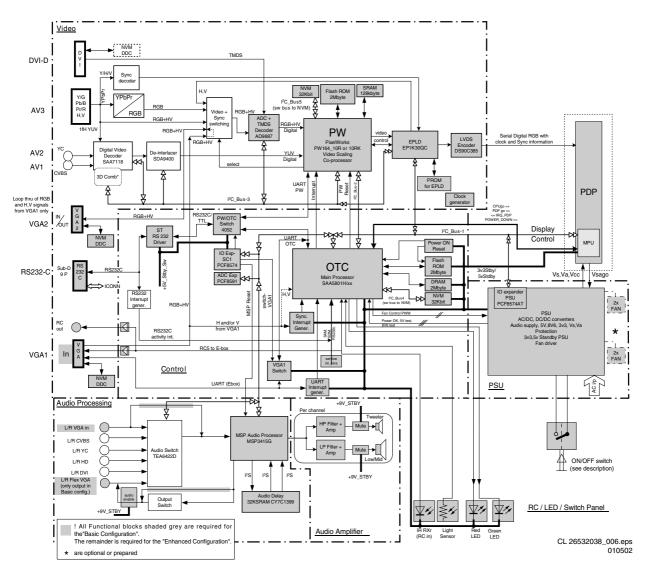

Figure 9-1 Control and Data Path

Input/Output 9.1.1

The main inputs are:

- Basic: VGA only.
- Enhanced: VGA, Flex-VGA, DVI-D, HD-RGB+HV, HD-2fH-YPbPr (sync on Y), 1fH-YCbCr (sync on Y), YC, CVBS on cinch. Flex-VGA gives the user a choice to configure the "loop-through VGA output" as an output or as input.

9.1.2 Video

This mainly consists of an analogue processing part and a digital processing part. The video inputs like VGA (Basic configuration), CVBS, YC, HD-RGB/YUV (1fH and 2fH) and DVI-D are received and processed.

The VGA signals are first converted to digital signals and then processed by the PW Scaler.

The YPbPr (2fH) signal is discretely converted to RGB, whereas the YCbCr (1fH) signal is processed in the SAA7118 Digital Video decoder.

The base-band video inputs (CVBS and YC) are output from this decoder as digital YUV, which are then further processed by the Pixel Works Scaler (PW).

The signals on the digital DVI input are first decoded by the TMDS decoder inside the AD9887 and then processed by the PW Scaler.

The PW Scaler output is going through an EPLD and then via an LVDS Encoder to the Fujitsu/Hitachi PDP (Plasma Display Panel) as differential serial data. This PDP is based on ALiS (Alternate Lighting of Surface) technology and is an interlaced display, with separate odd and even fields to be displayed.

Audio

This mainly hosts the audio inputs for the various video inputs. They go through an I2C controlled source selector. The main audio processing is done by the Micronas MSP3415G version with built-in Ultra Bass-II algorithm.

A digital delay line is created using the I2S channel and SRAM. The delay created can be selected between two values, one for the Receiver box, and one for the Monitor.

The processed audio signals are then differentially transmitted to the audio amplifier panel. This amplifier drives a tweeter and a twin-drive woofer (low/mid range). Active filtering is done before the amplifiers.

9.1.4 Control

The main controller is the OTC, referred to as the "main processor". This operates in co-ordination with the processor in the Pixel Works Scaler (PW), referred to as the "co-processor".

When the plasma monitor is connected to an F21RE Receiver box, the UART commands from the Receiver box will control the monitor.

In stand-alone mode, the monitor can be controlled via the Remote Control or via the RS232C port.

DDC1/2B (Digital Data Channel, an I2C-based protocol) is implemented with separate identification NVMs for the two VGA inputs and the DVI-D input as well. In addition, the RS232C port can be used for software download to the PW and the OTC. The target for downloading is controlled via a switch in the RS232C path; the switch itself is controlled by the OTC.

9.1.5 **Power Supply**

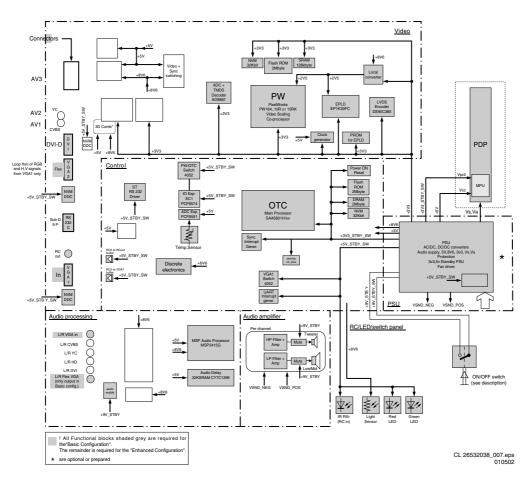

Figure 9-2 Power Supply Path

The PSU consists of a pre-conditioner part and a DC/DC converter part. This converter supplies power to the PDP high voltages, the auxiliary voltages, and the audio amplifier. There is a separate standby power supply, which supplies the Main Processor, PDP microcontroller, interrupt generator and some other circuits.

The mains inlet module will host the inlet and filtering.

There is a functional "Mains on/off" switch on the LED panel. This switch is on the secondary side, controlling the relays on the primary side.

9.2 Power Supply Unit (Diagrams P)

9.2.1 Introduction

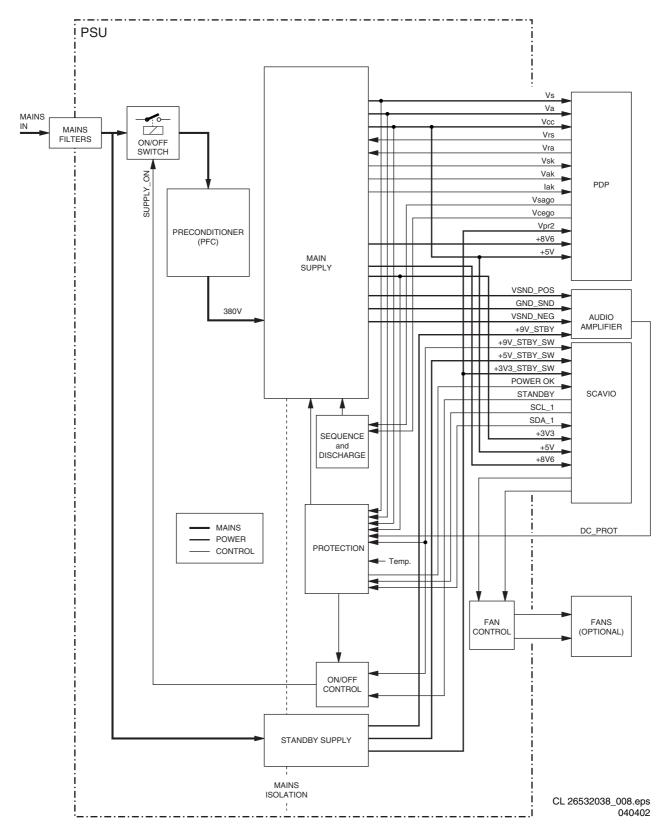

Figure 9-3 Power Supply

Table 9-1 I/O Overview Power Supply

Name	I/O	Value	Description			
+3V3	Out	+3.3 V_dc	To supply small signal digital circuitry.			
+3V3_STBY_SW	Out	+3.3 V_dc	To supply small signal digital circuitry, needing power in standby			
+5V	Out	+5 V_dc	To supply small signal digital circuitry.			
+5V_STBY_SW	Out	+5 V_dc	To supply small signal digital circuitry, needing power in standby			
+8V6	Out	+8.6 V_dc	To supply the small signal analogue circuitry.			
+9V_STBY	Out	+9 V_dc	Signal to functional ON/OFF switch.			
+9V_STBY_SW	Out	+9 V_dc	Signal from functional ON/OFF switch.			
DC_PROT	In	H/L	Signal from audio amplifier to switch OFF the power supply in case of a safety problem.			
FAN_SP_1	In	H/L (TTL level)	PWM signal from uP to control optional fans (group 1).			
FAN_SP_2	In	H/L (TTL level)	PWM signal from uP to control optional fans (group 2). Not for FM33.			
FAN_SUPPLY_1	Out	5 to 13 V_dc	Supply voltage for optional fans (group 1).			
FAN_SUPPLY_2	Out	5 to 13 V_dc	Supply voltage for optional fans (group 2). Not for FM33.			
l_ak	Out		Signal to measure 'I_a' in PDP (I_ak= 1 x I_a).			
Mains	In	110/240 V_ac, 50/60 Hz	Mains voltage.			
POWER_OK	Out	H/L (TTL level)	Signal to an interrupt pin of the uP, which indicates that the power supply is in regulation.			
			If an error occurs, signal goes from H to L.			
SCL_1	In	H/L	I2C clock line from uP.			
SDA_1	In/	H/L	Bi-directional I2C data line from/to uP.			
	Out					
STANDBY	In	H/L (TTL level)	Signal to switch the PSU to standby mode.			
V_a	Out	+30 to +70 V_dc	To supply the addressing circuitry in the PDP.			
V_ak	Out		Signal to measure Va in PDP (V_sk= 0.036 x V_a).			
V_cc	Out	+5 V_dc	To supply small signal digital circuitry in the PDP.			
V_cego	In	H/L (H= +2 V_dc)	Signal to switch the low voltage supplies ON/OFF.			
V_ra	In		Signal to control Va (V_a= 30 + (20 x V_ra)).			
V_rs	In		Signal to control Vs (V_s= 70 + (10 x V_rs)).			
V_s	Out	+70 to +90 V_dc	To supply the sustain circuitry in the PDP.			
V_sago	In	H/L (H= +2 V_dc)	Signal to switch the high voltage supplies (V_s and V_a) ON/OFF.			
V_sk	Out		Signal to measure V_s in PDP (V_sk= 0.029 x V_s).			
V_SND_POS	Out	+14.5 V_dc	To supply the audio amplifier panel.			
V_SND_NEG	Out	-14.5 V_dc	To supply the audio amplifier panel.			

The Power Supply Unit (PSU) is designed to provide regulated output voltages for the plasma display panel (PDP) and the built-in electronic panels (such as e.g. the SCAVIO and Audio Amplifier panels).

It houses the Pre-conditioner, DC/DC converters and the Standby circuitry. In addition, this panel will house the protection and the (optional) fan drive circuitry.

The mains inlet is mounted alongside the SCAVIO panel. It consists of the necessary high and low frequency mains filters.

The mains AC voltage is applied to the input filter and then fed to the standby supply. This supply is always operational and delivers the +9V_STBY voltage.

The task of the main supply is to deliver the supply voltages for the several electrical circuits in the plasma monitor.

It is switched via two single-pole relays, which are powered from the +9V_STBY voltage and controlled via the SUPPLY_ON signal.

The reason to choose for a separate standby supply instead of a single flyback supply is the requirement to have a low standby power consumption.

The PSU consists of the following parts (which are described separately):

- Mains inlet and filter.
- Standby supply.
- Fan control (optional).
- Pre-conditioner.
- LLC supply.
- Aux. supply.
- Protections.

Notes:

- To understand the descriptions below, see also the diagrams in Chapter 7.
- The descriptions are valid for the whole FM-range (FM23, FM24, and FM33). Where there are deviations, this will be highlighted per chassis.

9.2.2 Mains Inlet and Filter (Diagram P2)

Introduction

The mains filter provides common-mode and differential-mode filtering, to fulfil legal and self-imposed limits. Additional provisions are mains spikes and lightning protection.

Operation

The mains voltage is provided via mains inlet 0308, after which it is fused by a T6.3A fuse (item 1400).

The next part, the mains filter, is optional. It consists of an LC common mode filter section. This filter consists of two capacitors (items 2402 and 2403) from both phase and neutral to ground (to reduce the leakage current) and an inductor (5401). Interferences on one of the phases are shorted to ground via these capacitors.

Inductor 5401 also provides a differential-mode filtering with capacitor 2400. Resistor 3401 discharges this capacitor after the mains is disconnected.

A second common mode filter is made around coil 5402 and capacitor 2401. A third filter is made around coil 5404 and capacitor 2412 (only for the FM24 and FM33).

Resistor 3400 is a high energy VDR. The advantage of this VDR is that it can handle 400 V_ac without risk of fire. At high voltage peaks (e.g. lightning surge) on one of the phases, the

9.

resistance of VDR 3400 will be very low, causing fuse 1400 to interrupt.

At a lightning surge on both phases with respect to chassis ground, mains filter 5401 will form a high resistance, through which the voltage will rise very sharply.

To prevent flashovers, a spark-gap/resistor combination (items 1402 and 3404) is implemented.

Standby Supply (Diagram P2) 9.2.3

Introduction

The standby supply is a separate power supply, meant to reduce power consumption of the plasma monitor in standby mode. The standby supply operates on the AC voltage from the input filter part, and has to deliver a stable 9 V voltage.

It has three "mains isolated" outputs, and one "hot" output:

- +9V_STBY (called +9V_STBY_SW after the "on/off" switch 1101), to power the "on/off" relays in the pre-conditioner.
- +5V_STBY_SW (derived from the +9V_STBY via voltage regulator 7540)
- +3V3_STBY_SW, to supply the microprocessor of the
- 25V_HOT, to supply the LLC controller.

The standby supply is also connected to the pre-conditioner output (400V_HOT), in order to deliver a voltage as long as possible, after switch "off" and at mains dips.

Operation

The standby supply is always operational when the AC input voltage is present, so even when the POWER switch is in the "off" position. After a small rectifier (D6512/6513) and buffer capacitor (C2503), the generated DC voltage is applied to an SMPS (Switched Mode Power Supply).

The SMPS itself is build around IC7500, a "TINYSwitch" TNY256. This IC contains a control circuitry and a power MOSFET. It uses a simple "on/off" control loop to regulate the output voltage. The generated +9V_STBY voltage at the secondary side is rectified by D6504 and smoothed by C2508. The supply for the TNY256 (pin 5) comes via resistor R3506 and L5500.

By using secondary sensing, a very accurate standby voltage and high efficiency is achieved. The sensing circuit uses a TL431 as reference voltage/error amplifier. Optocoupler 7501 is used for the mains isolation.

When the output voltage rises, the reference voltage on the TL431 will exceed 2.5 V and the current through this device and the optocoupler LED will increase. By this, the optocoupler transistor will conduct more. When this current (at pin 4 of IC7500) exceeds 50 A, the MOSFET is switched "off", and the output voltage will drop. When this current drops below 40 A, the MOSFET is switched "on" again.

During the time that the MOSFET is "on", the IC has no supply voltage. To overcome this period, the energy stored in the bypass capacitor C2513 is used. This capacitor is charged during the time the MOSFET is "on".

As the TNY256 is sensitive for transients (mains spikes), a "peak clamp" circuit (300 V zenerdiodes 6501 and 6502) is used to limit the voltage to a safe level.

Fan Control (Optional, Diagram P4)

For ceiling mount or portrait-mode use, there is foreseen in four (two for the FM33) optional fans. The temperature within the monitor is measured via a sensor (R3372, KTY81) on the PSU. This sensor is, via A/D converter (item 7530 on the SCAVIO), connected to the OTC. According the temperature within the cabinet, the OTC-software will drive the PWM output of the OTC. The output (FAN_SP_x) is connected to the PSU, where a corresponding voltage is generated to supply the fans. This FAN_SUPPLY_x voltage is proportional to the duty cycle of the corresponding PWM signal.

The OTC senses the temperature every five s. If it has reached the alarm temperature, and this value has been measured three times consequently, the monitor will go into protection and a error-code is generated.

9.2.5 Pre-conditioner (Diagram P5)

Warning: the pre-conditioner does not provide mains isolation.

Introduction

The European Law describes a reduction of mains harmonics for apparatus with a power consumption above 75 W. Therefore the pre-conditioner is designed. This module serves as the interface between the mains input and the V_s/V_a

The advantage of a pre-conditioner is (compared to a mains input filter):

- Reduction of mains harmonics to legal limits.
- Lower mains current for the same output power.
- Power factor close to 1.
- Stable regulated output.
- Small and low weight.

The input voltage of the pre-conditioner is universal, between 95 and 264 V_ac. The output is 400 V_dc (400V_HOT) with a maximum output power of 300 W (FM23) or 400 W (FM24 and FM33). This output voltage is delivered to the V_s supply.

Operation

Start-up

The two relays (1450 and 1460, diagram P2) are controlled via the SUPPLY_ON signal. This signal will become "high" when the +9V_STBY_SW, the STANDBY (from the OTC), and the LATCH signal are "ok". It then switches indirect relay 1450 via transistor 7460 and so enables the use of a small, low voltage, switch.

To protect rectifier 6600 and relay 1450, the inrush current is limited to a maximum of 20 A by charging the capacitor 2605 through a PTC (items 3450 and 3451) and an NTC (items 3452 and/or 3453).

After approximately 0.5 sec, relay 1460 is activated. This relay will short the PTCs. The advantage of using an NTC, is the fact that the resistance varies with the current and hence the mains voltage. At a high mains voltage, the current is lower for the same power.

Two clamp diodes 6605 and 6606, charge output capacitor C2616 to the peak voltage of the mains input. During normal operation, both diodes are blocked because of the output voltage of 400 V_dc, and will only conduct if there is a mains spike or an output dip.

Capacitor 2616 then delivers, via R3668, the start-up voltage at pin 16 of IC7650. After the start-up cycle, IC7650 is supplied via auxiliary winding 1-2. Capacitor C2663 is charged during the cycle that MOSFET 7610 conducts. While MOSFET 7610 is switched "off", this capacitor transfers its energy via D6661 to:

- The input of stabiliser IC7660 (for FM23 and FM24).
- The input of DC-DC converter IC7661 (for FM33). This circuit was changed for a better efficiency.

The output voltage of this IC is fed via D6665 to V_cc pin 12 of IC7650. The slow start function is realised by the circuit consisting of transistor 7654, D6654, R3654, and C2654.

Normal Operation

An up-converter circuit is used for the pre-conditioner. The switching frequency of the converter is chosen much higher than the mains frequency. It is therefore possible to consider the supply as constant, during every high frequency period,

The output voltage of the pre-conditioner equals the input voltage, when the MOSFET is continuous switched "off", and increases while the MOSFET is switched "on".

The rectified mains input voltage is connected to pin 5 of IC7650 via voltage divider R3603/04/05 and R3651. This voltage is proportional with the mains input, and is used to change the duty cycle of the pulses, which are generated at pin 11. Because the width of these pulses is not small enough, the circuit around transistors 7640 and 7641 is added. It decreases the duration of the square wave by 500 ns (this value is set by R3640 and C2640).

A demagnetisation winding (pin 1-2 of L5600) detects when there is no energy in the transformer. This information is fed to IC7650 pin 7 and this is used to switch "on" the MOSFET (7610). In this way, the dissipation is very low, combined with a

The MOSFET 7610 is switched "off" at high currents, up to 15 A. To reduce dissipation, this is done at high speed for which "turn off driver" T7608 is used.

The output voltage (400 V) is divided by R3680/81/82 and R3671 and connected to pin 3 of IC7650. A change in the load will adjust the duty cycle of the gate pulse at pin 11, in order to keep the output voltage constant. Therefore, there is no need to adjust the output voltage by means of a potentiometer.

Protections

Current Protection

The current through FET 7610 flows also through the sense resistors 3614 and 3615. The voltage across these resistors is fed to pin 6 of IC7650. If the current exceeds its reference level, the pre-conditioner will switch "off". A filter, formed by C2666 and R3666, avoids unnecessary protection triggering due to spikes.

C2665 and R3665 on pin 13 determine the maximum oscillating frequency.

9.2.6 LLC Supply (Diagram P6)

Introduction

The V_s supply (70-90V) is based upon the so-called LLC converter technology (also used in the MG3.1 and FTV1.9). It is used to supply the power of the sustain pulses, which generate the light in the PDP. The voltage is set by a reference DC voltage (V_rs), coming from the PDP.

The V_a voltage (derived from V_s) is used to supply the power for driving the addressing electrodes of the PDP. The value of V_a is also depending on a reference voltage (V_ra) coming from the PDP.

The main supply hosts the following supplies:

- V_s supply, via an LLC converter.
- V_a supply, derived from V_s via a down converter.
- V_cc, via a flyback converter.
- 3V3, via a down converter.
- Audio amplifier supplies (V SND POS and V_SND_NEG), via a transformer.

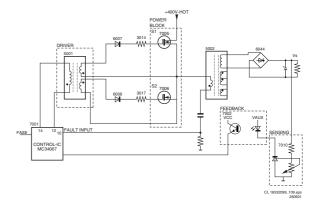

Figure 9-4 V_s supply

The start-up voltage for the IC is derived from one phase, the IC starts to oscillate, and alternately S1 and S2 are driven into conduction with a dead time in between. This effects that, via the resonance circuit and the MOSFETS, energy is stored into transformer L5002 (and L5004 for FM24 and FM33).

The secondary voltages are rectified and smoothed, these voltages are, via a voltage divider, fed to the optocoupler that influences the oscillator frequency of the control IC and stabilises the secondary voltages. If the current becomes too high, the supply is switched "off" via the fault input of the control

Advantages:

- High efficiency (more then 90%, other supplies 75%).
- Less radiation.
- Cost effective (two MOSFETS of 400 V cost less than one MOSFET of 600 V).

Disadvantages:

- Very low power stand-by impossible.
- Realisation and stabilisation is more complex.

Operation V_s Supply

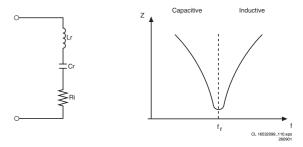

Figure 9-5 Impedance characteristic

The LLC supply is a serial resonance power supply. The coil, resistor, and capacitor form a trap at the resonance frequency f_r. The impedance is frequency dependent. The smallest impedance is at the resonance frequency (f_r), at the right side of f_r is the inductive part, and at the left side the capacitive part. The supply works in the inductive part, since higher frequencies causes minor losses.

Stabilisation is realised, by regulating the frequency as function of the output voltage (V_S_UNSW) and power. The load is stabilised by influencing the series-loop. The higher the frequency, the lower the output power.

The supply voltage of the control IC comes from the 25V HOT voltage of the standby supply (via stabiliser 7093), and is lead to pin 15 of the IC. The IC starts to oscillate. This supply line has a short-circuit protection via opto-coupler 7003; when the

supply is regulating, the current through the opto-coupler is amplified and will deliver power to the IC.

Control is done in the usual way by a TL431 at the secondary side. Voltage V_rs, a control signal coming from the display, is mixed into the feedback voltage, using an additional TL431 (7011 at schematic P6). It influences the output of the V_s supply. The output voltage of the V_s supply varies according the following formula: $V_s = 70 + (10 * V_rs)$. Via this stabilisation circuitry for V_s, the output voltage is stabilised. If necessary, it is possible to adjust the voltage via potmeter R3026 (not for FM33).

The V_s is fed via a voltage divider to IC7010 (TL431). If the voltage at pin 3 of IC7010 is higher than 2.5 V, a current will flow from cathode to anode. This current also flows through the secondary side of the optocoupler 7002. The voltage at pin 7 of the MC34067, determines the output frequency. The higher this voltage, the higher the output frequency. Thus, if the voltage on pin 7 increases, the frequency increases and V_s decreases.

When the output voltage rises, the voltage at the reference IC7010 also rises, this causes the current through the diode of the opto-coupler to rise. The transistor of the opto-coupler conducts more, because of which the voltage at pin 7 of the MC34067 increases.

Accurate Over Voltage Protection (OVP) is added, using a TL431 (7304, diagram P3) as reference/comparator and an additional optocoupler (7003) that acts on the fault input pin 10 of the MC34067P (see also "Power Supply Protections").

The Controller

The MC34067P controller, is used for the following reasons:

- Zero voltage switching
- Variable frequency oscillator (above 1 MHz).
- Precision one-shot timer for the dead time.
- 5 V reference output.
- Double, high current totem-pole output.
- Soft start.
- Wideband error amplifier.
- Fault input (protection).

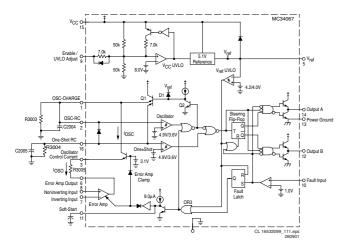

Figure 9-6 MC34067

The oscillator circuit is build around an internal comparator with two threshold-voltages: 4.9 and 3.6 V.

C2004 is first charged via transistor Q1. If the voltage across C2004 is more then 4.9 V, the output of the upper comparator becomes low, the NOR-port output will be high, and Q1 will be blocked because the base will be shortened by Q2. C2004 will be discharged via the resistors R3003 and the oscillator control current (Losc).

If the voltage across C2004 is below the lower threshold (3.6 V), transistor Q1 is conducting and the capacitor is charged

again. The oscillation frequency is modulated by the oscillator control current.

The discharge current increases, when pin 3 is loaded even more; thus the lower the voltage on pin 3, the higher the oscillator control current and the higher the frequency. The maximum frequency is reached when the output of the error amp is minimal (0.1 V). Thus, R3005 determines the maximum frequency.

The minimum frequency is reached, when I_osc current is zero: C2004 then discharges only via the resistor R3003.

One Shot Timer

The one-shot timer is present, to de-activate both outputs simultaneously, and to provide a dead time, so that only one output will be activated.

The one-shot capacitor (C2005) is first charged by Q1. The one-shot period begins when the oscillator comparator is switched "off" by Q1. The one-shot capacitor is discharged via the parallel resistance (R3004): if this voltage gets lower than the lower threshold of 3.6 V, the comparator will be high and controls the flip-flop, which makes one of both outputs high. If Q1 is re-conducted through the oscillator comparator, the one-shot capacitor is re-charged.

Fault Detector Input

At pin 10, there is a fault detector input. If this voltage reaches 1 V, the output of the OpAmp goes high, and both drive outputs are switched "off".

In addition, the output of OR3 will be high via the "fault latch". The output of OR3 drives Q1, so both the oscillator and the one-shot-capacitor remain charged. Via OR3, the soft-start capacitor is discharged.

Soft-start

Due to the soft-start circuit, the oscillator starts with maximum frequency. The low voltage on the soft-start capacitor (C2027) is buffered and keeps the error amplifier output low (if I_osc = $max then f_osc = max).$

The capacitor is charged with a current of 9 uA, the output of the buffer gets high, and the error amplifier input takes charge of the oscillator control current.

Driver stage

The two secondary windings of the driver transformer control the two switching MOSFETs. The primary winding of the driver transformer is alternately controlled by the two totem-pole outputs of the controller. Cross-conduction of both MOSFETs is prevented by the dead time.

The gate of each MOSFET is controlled via diodes 6007/6008 and resistors 3014/3017.

The transistors 7007/7008 discharge the gate faster by switching "off" situations.

The diodes 6017/6028 at the base-emitter of 7007/7008 prevent the zener effect of these transistors.

The zener diodes at the gate-source of 7005/7006 are for ESD protection

C2011 and C2014, form the capacity for the series resonant circuit.

MOSFET switching

The total switching time can be distributed over 12 phases with different current paths. Only four phases are discussed to simplify the explanation:

Phase 1 (S1 closed, S2 open)

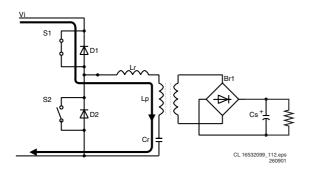

Figure 9-7 Phase 1 Resonance Supply

The gate of MOSFET 1 is positive, which causes S1 to close. The input voltage Vi of 400 V_dc provides a current flow through S1 and the series circuit. At the same time, a current flows through the rectifier diodes in the secondary winding, which will charge capacitor Cs.

The current through Lr starts negative, but it is increasing to change polarity.

Capacitor Cr is charged sinusoidal, while the voltage at Lr drops. This makes the current drop.

Phase 2 (S1 open, S2 open = dead time)

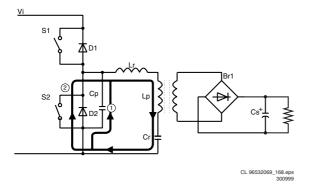

Figure 9-8 Phase 2 Resonance Supply

Before the current reaches zero, S1 is opened. Now, both MOSFETs are not conducting. However, the current through the coils wants to continue. The capacity Cp releases its load to the series circuit, and the voltage at Cr continues to rise (Cp is the sum of several parasitic capacities).

- 1) The voltage at the drain of MOSFET 2 drops, because Cp is discharged at this moment [1]. This causes a voltage inversion across Lr and Lp. The secondary winding begins to feed back, charging capacitor Cs.
- 2) The voltage becomes negative, and diode D2 starts to conduct [2]. The secondary bridge remains conducting.

Phase 3 (S1 open, S2 closed)

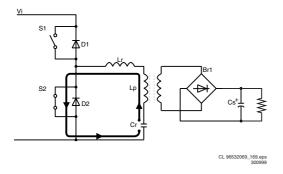

Figure 9-9 Phase 3 Resonance Supply

The gate of MOSFET 2 is becoming high. The current through D2 is taken over by MOSFET 2. The switching losses are negligible, because the voltage across the switch is now approximately 1 V.

The current through Lr starts negative, but is increasing to change polarity. A current flows through MOSFET 2 and the series circuit. The bridge remains conducting, but its current gets zero because of the decreasing voltage across Lp. This is caused by the discharge of capacitor Cr. The voltage at capacitor Cr is decreasing sinusoidal and so is the voltage across Lp and Lr.

Phase 4 (S1 open, S2 open = dead time)

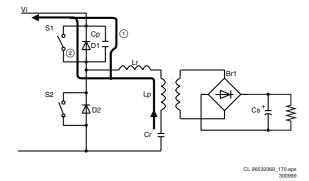

Figure 9-10 Phase 4 Resonance Supply

Before the current reaches zero, S2 is opened. Now, both MOSFETs are not conducting, but the current through the coils wants to continue. The capacity Cp releases its load to the series circuit, and the voltage at Cr continues to fall (Cp is the sum of several parasitic capacities).

1) The voltage at the drain of MOSFET 2 increases, because Cp is discharged at this moment [1] (Cp was charged to 400 V). This causes a voltage inversion across Lr and Lp. The secondary winding begins to feed back, charging capacitor Cs. 2) The voltage becomes higher than 400 V, and diode D1 starts to conduct [2]. The secondary bridge remains conducting.

Protections MC34067

Over Current Protection (OCP)

The voltage at R3021 is a criterion for the current, which flows through the primary winding. Via C2015 and D6010, the negative information is clamped at -0.6 V. The total amplitude is rectified via D6009 and C2010, and via R3020 and TS7009 supplied to the fault input (pin 10) of the controller. When the fault input is higher than 1 V, the protection is activated.

Over Voltage Protection (OVP)

The voltage at R3010 is the take-over-winding voltage. This voltage is also supplied to pin 10 of the controller via a voltage divider R3010/R3011 When the fault input is higher than 1 V, the protection is activated.

Soft-start Over Current Protection

If short-term over current peaks occur, the frequency is adapted. The voltage at R3021 is clamped at -0.6 V via C2015 and D6010. The total amplitude is rectified via D6011 and C2008, and supplied to the "thyristor" TS7017/18 via R3012. When the voltage at the emitter of TS7017 gets higher than 5 V, the soft-start capacitor C2027 is discharged and the frequency increases. Because of this, the V_s will drop. If this voltage remains 5 V, the supply is interrupted (hick-up). This circuit is adjusted in such a way, that the voltage does not drop too much if a flash occurs.

Aux. Supply (Diagram P7)

The "Aux. Supply" part hosts the supplies that are derived from the V_s supply:

- V_a supply.
- V_cc supply.
- 3V3 supply.
- Audio supply (V_SND_POS and V_SND_NEG).

In the FM24 monitor, a circuit is added (around 7143, 7144, and 7145), which takes care that the V_a and V_s supplies are discharged immediately after set switch "off". This to prevent discharge spikes of the elcaps. The circuit will ground the supply voltage of IC7112 as soon as its trigger line (+9V_STBY_SW) is switched "off".

V_a Supply

The V_a voltage is derived from the V_s voltage via the "down converter" principle. Control IC TEA1507 (item IC7112) and MOSFET TS7117 are used.

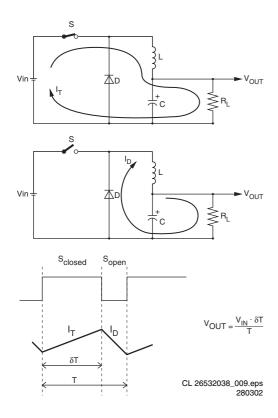

Figure 9-11 Principle of Down Converter

After closing switch "S", the linear in time increasing current I_T will charge capacitor C.

Opening switch "S" will generate a counter-e.m.f. (= reverse voltage) in coil L, trying to maintain current I_T. This is possible via diode D (this diode is also called "freewheel diode").

Therefore, after opening "S", the magnetic energy stored in coil L will be transferred to electrostatic energy in capacitor C. The V_in will only supply current during the time that "S" is closed while a constant current is flowing through R_L.

V_out is directly proportional with V_in and the time that "S" is closed, and reverse proportional with period time "T". Therefore, by changing the duty cycle, it will be possible to

control V_out. To apply this on this chassis (diagram P7): replace switch "S" by FET TS7117, coil L by L5120 (or L5121 for the FM33), diode

D by D6120, C by C2121, V_in= 77-100V, and V_out= V_a.

Stabilising is done in the same way as for the V_s supply. Voltage V_ra, coming from the display, is mixed into the feedback voltage using an additional TL431 (item 7130). This influences the output of the V_a supply. The output voltage of the V_a supply varies according the following formula: V_a = 30 + (20 * V_ra).

V_cc Supply

This part delivers, besides the V_cc voltage, also +12V (+10V for the FM33) for the optional fan control and, derived from this voltage, an +8V6 (for small signal analogue circuitry). The V_cc voltage is derived from the V_s voltage via the flyback converter principle. Control IC TEA1507 (item 7212) and MOSFET 7217 are used.

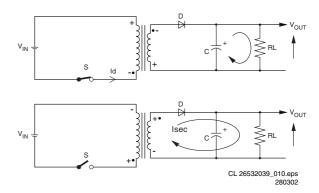

Figure 9-12 Principle of Flyback Converter

After closing switch "S", the current I_D will increase linear in time. The magnetic energy in the primary coil is directly proportional with the self-inductance of the coil and current I_D (thus with the time the switch is closed).

The voltage polarity at the secondary winding is negative (due to different winding direction), meaning that diode D will block. Capacitor C will discharge via R_L, and V_out will decrease. Opening switch "S" will generate a counter-e.m.f. in the primary winding, trying to maintain current I_D. Through this the polarity of the secondary voltage will inverse. The magnetic energy, stored in the coil, will now be transformed to the secondary side. Diode D will now conduct, capacitor C will be charged and V out will increase.

To apply this on this chassis (diagram P7): replace switch "S" by FET TS7217, coil L by L5220, diode D by D6224, C by C2224, V_in= V_S_UNSW, and V_out= V_cc.

Note: While in the FM23 and FM24 the +12V is derived via the flyback converter principle, in the FM33 this is done via a voltage doubler circuit.

The negative side of C2229 has an average voltage level of 0 V as it is connected to the secondary side of L5220. Its positive side is connected to the +5V (V_cc). When diode D6225 conducts, there will be +5.5 V on its anode (+5 V plus the forward voltage). This means that there will be +10.5 V at the positive side of C2229. The resulting voltage over C2230 will be +10 V (+10.5 V minus the diode forward voltage of D6230).

3V3 Supply

The +3.3 V is generated to supply the SCAVIO panel. This voltage, is directly derived from the LLC supply (diagram P6):

- FM23: Via a fuse (1005/1045), this voltage is rectified by diodes 6021/6045 and smoothed by C2022 (+18V line). Via control IC L4973V (item 7260, diagram P7), the 3V3 voltage is generated. This IC contains a complete down converter, with integrated MOSFET.
- FM24: Via a fuse (1005/1045), this voltage is rectified by diodes 6021/6045 and smoothed by C2022 (+15V line). Via control IC L4973V (item 7260, diagram P7), the 3V3 voltage is generated. This IC contains a complete down converter, with integrated MOSFET.
- FM33: Via a fuse (1082/1083), this voltage is rectified by diodes 6021/6045 and smoothed by C2022 (+9V line). Via control IC L6910 (item 7260, diagram P7), the 3V3 voltage is generated. This IC contains a complete down converter, with integrated MOSFET. This IC has a better efficiency

compared to the L4973V that is used in the FM23 and FM24.

All these circuits use double diodes per voltage, in order create a symmetrical load for the transformer.

Audio Supply

This is a "floating" symmetrical supply (±14.5 V) derived from V_s via transformer 5290. Because this voltage is tightly coupled to the V_s voltage, this voltage varies considerable, between 11 V (max. load, V_s = 70 V) and 20 V (min. load, V_s = 90 V

The Audio ground is connected to the normal secondary ground, with a capacitor (C2290) and a resistor (R3292) in parallel, in order to suppress spurious oscillations.

Power Supply Protections (Diagram P3)

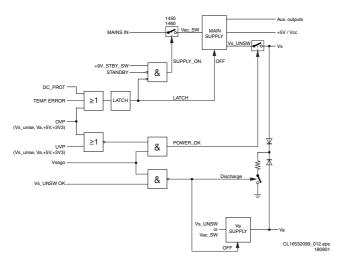

Figure 9-13 Protections

In general, all efforts are taken, to make a safe power supply. Therefore, all major outputs are monitored with respect to overand/or under voltage. All protections are handled by hardware. The software only monitors the hardware to generate error codes for service.

Via I2C, errors of the power supply are transmitted to the microprocessor on the SCAVIO panel. If an error occurs, the POWER_OK line will change from "high" to "low". The errors are transmitted to the microprocessor, on the following ports and pin numbers of the I/O expander PCF8574AT (item 7370):

Table 9-2 IC7370 Inputs

Pin	Name	Description				
4	V_s	Detection of under- or overvoltage on V_s				
5	V_a	Detection of under- or overvoltage on V_a				
6	+5V	Detection of under- or overvoltage on +5V				
7	+3V3	Detection of under- or overvoltage on +3V3				
9	OVP	Detection of overvoltage on V_s, V_a, +5V or +3V3				
10	Switch	Detection of functional switch				
11	DC_PROT	Detection of DC_PROT going high				
12	TEMP	Detection of over temp. inside power supply				

This POWER_OK signal is connected to an interrupt pin of the OTC, in order to be read as fast as possible. This is very important in case of a time-limited error like over-voltage. After detection of the error, the control system will log the error in NVM, and transmit the first occurrence back to the power supply through the I2C bus.

Note: The POK signal is fed to buffer 7366, together with the "8V6_UNDER_VOLTAGE" and "SWITCH" sensing. The output of this buffer, the POWER_OK line, will follow the inputs.

Operation

V_s Protection

Detection of over- or under voltage on V_S_UNSW by comparators IC7308-A and -B. If this voltage exceeds certain levels (set via voltage dividers), the protection will activate the Power OK (POK, active "low"), which will shut down the set.

V_a Protection

Detection of over- or under voltage on V_a by comparators IC7308-C and -D. If this voltage exceeds certain levels (set via voltage dividers), the protection will activate the Power OK (POK, active "low"), which will shut down the set.

V_cc Protection

Detection of over- or under voltage on V_cc (+5 V) by comparators IC7330-A and -B. If this voltage exceeds certain levels (set via voltage dividers), the protection will activate the Power OK (POK, active "low"), which will shut down the set.

+3V3 Protection

Detection of over- or under voltage on the +3V3 voltage by comparators IC7330-C and -D. If this voltage exceeds certain levels (set via voltage dividers), the protection will activate the Power OK (POK, active "low"), which will shut down the set.

OVP protection

This line detects, if one of the above mentioned voltage protections is an over-voltage protection. Therefore, this works in combination with the above-mentioned under/over voltage protections.

Latch Protection

When an OVP-, DC-, or Temperature protection occurs, thyristor 6348 is fired and the LATCH signal is made "low". This signal will switch "off" the main supply and prevents that the supply is switched "on" again, as long as the protection is active.

In addition, the V_cego signal can activate the LATCH signal (via TS7352 and 7348), but this is temporarily. This is done for correct start-up behaviour.

DC Protection

Detection of a DC voltage on the audio amplifier outputs. If a DC voltage is detected, TS7362 will activate the Power OK (POK, active "low"), which will shut down the set.

Temperature Protection

- FM23 and FM24: Detection of the temperature (via PTC 3368) in the power supply by comparator IC7366-A. If this voltage exceeds a certain level (set via voltage dividers), the protection will activate the Power OK (POK), which will shut down the set.
- FM33: via an I2C temp sensor IC7372. This LM75A is a temperature-to-digital converter using an on-chip temperature sensor, and provides an Over-temp Shutdown (OS) output. It communicates via I2C. The device is powered-up in normal operation mode with the OS in comparator mode, temperature threshold of 80 °C and hysteresis of 75 °C, so that it can be used as a stand-alone thermostat with those pre-defined temperature set points.

9.3 **VGA Connector Panel (Diagram VGA)**

The Video Graphics Array (VGA) panel serves as an interface between the peripheral VGA equipment (Receiver box, PC, etc.) and the SCAVIO panel. Some specifications of this panel:

- Two NVMs are present, which hold identification data for the DDC line.
- Further, there are buffers present for the incoming and outgoing sync signals.
- RC_OUT cinch for linking with other equipment.
- Provision to terminate the incoming sync lines with 75 Ohm via the EBOX_PRESENT line.

For a description, see the next "SCAVIO" chapter.

9.4 **SCAVIO Panel (Diagrams SC)**

The Scaler Control Audio Video Input Output (SCAVIO) panel contains:

- All the input connectors,
- Analogue and digital video processing,
- Scaler (co-processor)
- Interface to the PDP.
- Audio processing (excluding the audio amplifier),
- OTC (main processor), and
- RS232C in/out.

Note: There are two versions of this panel, a Basic and an Enhanced version. Therefore, many components are not mounted for the Basic version.

For the circuit description, we divide the board into the following parts:

- Supply 1
- Video processing
- 3 Audio processing
- 4. Control

Supply 9.4.1

See figure "Power Supply Path" in paragraph "Power Supply 9.1.5".

Video Processing (Diagrams SC3, 4, 5, 6, 10, 11 and 12)

Introduction

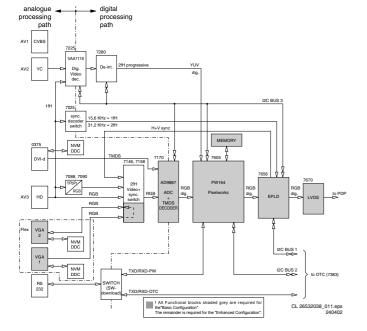

Figure 9-14 Video path

This mainly consists of a small analogue processing part and a bigger digital signal processing part.

The video inputs like CVBS, YC, High Definition RGB, or YUV (1fH and 2fH), VGA, and DVI-D are received and processed. The YPbPr (2fH) is discretely converted to RGB, whereas the YCbCr (1fH) is processed in the SAA7118 Digital Video decoder. The base-band video inputs (CVBS and YC) are output from the digital video decoder as digital YUV, which are then further processed by the Pixel Works Scaler.

The VGA signals are first AD converted and then processed by the PW Scaler.

The digital input on the DVI is first decoded by the TMDS decoder inside the AD9887 and then processed by the PW Scaler.

The PW Scaler output is going through an EPLD and then via the LVDS transmitter to the PDP (Plasma Display Panel) as differential serial data. The PDP is based on ALiS (Alternate Lighting of Surface) technology and is an interlaced display, with separate ODD and EVEN fields to be displayed.

Analogue Video

This part describes the analogue video and synchronisation path of all inputs, until it reaches the "analogue digital converters" of either the AD9887 (ADC+TMDS Decoder) or the SAA7118E (Digital Video Decoder).

In addition, the switching part is described and the necessary control signals.

In principle, all video control functions are done by the Pixel Works processor.

Note: This part also includes the VGA connector panel that is mounted on top of the SCAVIO panel.

Inputs

There are five video inputs, which are divided in three types:

- VGA (2fH): named VGA1 and VGA2. Both are 15-pole SUB-D connectors for RGB and HV, and are situated on the VGA connector panel. For automatic identification by a PC, each VGA input is foreseen with a DDC NVM IC. VGA2 is set default as loop through of VGA1. In the Enhanced version, VGA2 can be switched as output, via the control signals VGA2_OUT and VGA2_EN.
- YPbPr/RGB (combined 2fH and 1fH): named AV3 and suitable for YCbCr/HD-YPbPr/HD-RGB + HV. These are cinch inputs. YPbPr and RGB are seen as separate inputs by the HW and must be properly selected by SW.
- CVBS like (1fH): named AV1 for CVBS and AV2 for Y/C. These are also cinch inputs.

The 1fH signals (including YPbPr) are buffered (item 7113/21/ 17) and go directly to a digital video processor, the SAA7118E (item 7225 on diagram SC5), where they are converted into a digital signal.

The 2fH signals are also buffered; both YPbPr (item 7074/84/ 79) and RGB (item 7141/38/35) buffers get the same input signals.

When YPbPr signals are connected, the correct input must be selected, to get a picture with proper colours. Thus, the signals must pass a video matrix (item 7088/90, see diagram SC3), where they are converted into RGB. There are two matrices, an NTSC and an ATSC. With the MATRIX SEL signal, the correct matrix is chosen (item 7089). The detection is done automatic, by an algorithm in the EPLD.

After the matrix, the signals enter a clamp/blanking circuit (7102/03/04 and 7100), for the removal of the residual sync signals. The control is done via the lines HD_BLANKN and HD_CLAMPN coming from the EPLD.

All RGB signals come together at 4-pole switches (item 7146/ 58), one for each colour, where they are switched to the AD converter item 7170 (R_ADC, G_ADC and B_ADC).

All incoming H and V sync signals go to a 4-pole switch (item 7009) where SYNC_SEL and VIDEO_SEL_2 determine, which signal is available on the ADC.

Before this switch, the VGA sync path is rather straight, only 1 switch (item 7007) is added for the VGA2 sync signals, which determines if VGA2 sync is input or output (VGA2_OUT). In the Basic configuration, these switches are omitted, and replaced by jumpers (4009/4010).

The external sync (AV1 - 3) signals are treated differently. Both H_HD_EXT and V_HD_EXT go to three circuits:

- A comparator circuitry with an LM319 (item 7025), to ensure both sync pulses are always positive going (H and V_SYNC_CMP),
- A level detection circuitry (items 7000 to 7002), to detect if the sync is of TTL level (H and V_SYNC_TTL),
- A positive/negative going detection circuitry (items 7006 to 7010), to indicate the polarity of the sync in case of TTL level (H and V_SYNC_POL_N).

All above-mentioned signals go to the EPLD (see diagram SC11) for further processing.

Processed sync signals H_HD and V_HD coming from the EPLD, are also switched to the ADC (H_ADC and V_ADC) along with the proper RGB signals (R_ADC, G_ADC and B_ADC).

Digital Video

This part describes the digital video path on the SCAVIO panel, starting at the AD converters in either the AD9887 (item 7170) or in the SAA7118E (item 7225) and ending at the output for the PDP.

For both the Basic as the Enhanced version, everything "after" the Pixel Works chip, is equal.

For the Basic version, the input for the Pixel Works only consists of the "Graphics path".

For the Enhanced version, it is both the "Graphics path" as the "Video path".

The SCAVIO panel contains the following functions in the video path:

- 1. The "YPbPr to RGB matrix" and "2fH Video+Sync Switch" are explained above in the "Analogue Video" part.
- 2. The "Digital Video" path containing the Digital Video Decoder and the De-interlacer.
- 3. The "Digital Graphics" path containing the ADC+TMDS decoder.
- The "Scaler" which is the Pixel Works (PW164-10R) plus Memory.
- The "EPLD" for sync decoding and video manipulation.
- The "LVDS" encoder.

The Digital "Graphics Path"

This is a straightforward application of the Analogue Devices AD9887 (item 7170). Inputs for this device are:

- FTV Receiver box,
- VGA formats (up to SXGA at 75 Hz),
- 2fH RGB+HV (only in Enhanced version),
- 2fH YPbPr, which is converted to RGB by the "YUV to RGB" matrix (only in Enhanced version),
- DVI-d (only in Enhanced version).

Analogue input: The AD9887 is meant to sample "pixel synchronous". To achieve this, a (software) driver is running on the Pixel Works processor (PW). After hooking up a source to the AD9887, the PW starts counting the number of lines per field and calculates the H-period time. With these two values, it determines the exact match or the closest match out of a lookup-table (LUT) with VGA standards. When the correct standard is determined, the PW will set the AD9887 I2C registers to the correct value. The AD9887 should now sample with exact the same frequency as the incoming standard requires. This is done to get an optimal picture performance.

It also is a "must" when a computer graphics card is connected, because there is no, or very little, post anti-aliasing filtering done on such cards. Therefore, the outputted RGB samples need to be exactly aligned with the sampling of the AD converter.

Analogue input signals can go up to "SXGA at 75 Hz" format, which gives a pixel clock of 135 MHz. In fact, it can handle any standard with a pixel rate up to 140 MHz.

Special modes are made for the F21R E-box, for both PAL and NTSC. These are invoked when an E-box is connected to the SCAVIO panel.

Digital input: Via the DVI connector (Enhanced version only) it is possible to insert TMDS (Transition Minimised Differential Signalling) data into the SCAVIO panel. DVI is a fairly new computer graphics standard, which can be seen as the digital follow-up of the analogue VGA interface. The TMDS signal is directly fed into the AD9887, where any DVI standard up to "SXGA at 60 Hz" can be decoded to RGBHV.

The preferred VGA standard for this chassis is programmed in the DDC EEPROM (item 7215), which can be read by the PC. Via an internal switch, it is possible to choose between the analogue input and the digital input. The output format is for both inputs the same (8 bit RGB plus HV). The driver determines whether the AD9887 outputs single or dual pixels. For lower standards like "VGA at 60 Hz", the interface will be single pixel, which means that every clock cycle one byte of R, G, and B data is outputted. Dual pixel means that on every clock cycle two bytes of R, G, and B data outputted. These two bytes are de-multiplexed, which is done to make the interface more robust for jitter, set-up, and hold times, and to reduce the digital data rate over the PCB (reduced EMC).

Digital "Video Path"

This path is only available in the Enhanced version of the SCAVIO panel and is used for the following input signals:

- CVBS input,
- Y/C input, and
- 1fH YPbPr.

It is a straightforward application of the Philips SAA7118 (item 7225) and the Micronas SDA9400 (item 7280).

The SAA7118 is a PAL/NTSC/SECAM Digital Video Decoder with adaptive digital comb filter and component video input. It decodes all input standards to 4:2:2 YCbCr, which then is processed by the SDA9400.

The SDA9400 is a motion adaptive de-interlacer, which makes a progressive video signal from the interlaced input. Depending on the motion in the picture, it will just interleave the odd and even field (no motion: ABAB) or repeats the same field twice; this is also known as line doubling (motion: AABB). The motion detection is pixel based, with a soft-switch between "motion" and "no motion".

After the de-interlacer, the signal is fed as a 4:2:2 YCbCr progressive scan signal to the video port of the Pixel Works processor.

The Pixel Works PW164 Scaler

The Pixel Works PW164 Image Processor is a highly integrated (Ball Grid Array, BGA) chip, which interfaces video inputs and computer graphics in virtually any format to the PDP.

Computer images from VGA to UXGA resolution input to the chip can be resized to fit on the PDP. Horizontal and vertical image scalers, coupled with intelligent frame locking circuitry create sharp images, centred on the screen and without user intervention. An embedded DRAM frame buffer and memory controller perform the frame rate conversion.

Video data from 4:3 aspect ratio NTSC or PAL and 16:9 aspect ratio sources such as HDTV and DVD are supported. Non-

linear scaling (only with Receiver Box) and separate horizontal and vertical scalers allow these inputs to be resized optimally for the native resolution of the PDP.

For more information, see http://www.pixelworksinc.com/ index.phtml

Table 9-3 Pixel Works Scaler: Ports

Pin	Name	I/O	Remark
C2	PW_SCL	+3V3 out	to I2C devices, Video related
B1	PW_SDA	+3V3 out	to I2C devices, Video related
A1	PW_SDA_NV M	+3V3 out	to I2C device NVM
C4	PW_SCL_NV M	+3V3 out	to I2C device NVM
ВЗ	VGA2_OUTN	+3V3 out	Selects VGA 2 as output. (Low => Output)
A2	VGA2_EN	+3V3 out	Enables VGA 2 (High = Enable)
A3	VIDEO_SEL_ 1	+3V3 out	to video selection switches (see truth table)
C5	VIDEO_SEL_ 2	+3V3 out	to video selection switches (see truth table)
B4	SCL_2	+3V3 out	to I2C device OTC
A4	SDA_2	+3V3 out	to I2C device OTC
C6	SYNC	Input	Is 'high' if EPLD detects sep- arate sync signals on YPbPr
B5	1_2FH	Input	Is 'high' if sync on YPbPr is 1fH (from EPLD)
D6	SYNC_SEL	+3V3 out	To sync selection switches
A 5	FBX_MODE	Input	Is 'high' if E-box is detected

Table 9-4 Pixel Works Scaler: Video Select

VIDEO_SEL_1	VIDEO_SEL_2	Selected input for AD9887		
0	0	RGB 2fh		
0	1	YPbPr 2fh		
1	0	VGA 1		
1	1	VGA 2		

Service remark: Desoldering/soldering of this IC requires very specialised (BGA) equipment. This can only be done by the Authorised Service Centres (ASC).

The EPLD

The main reason to add the EPLD is the contrast reserve function. Other reasons:

- Black and white ADC adjustment. The EPLD provides a high-resolution measurement of the black and white level, to adjust the gain and offset of the ADC (AD9887). It is read
- LVDS reset. This function resets the LVDS transmitter on the SCAVIO board, in case the LVDS transmitter starts up without a clock. This could cause an abnormal picture. Therefore, as soon as the clock is not fast enough (as during start-up) the EPLD will keep the LVDS transmitter in reset.
- Receiver-box mode detection. For loop through mode (a second FTV monitor connected to the output of the first monitor), a secondary detection is needed to check the presence of an Receiver or E-box.
- ATSC sync detection/ decoding. Core for proper sync decoding for ATSC sources.
- Contrast reserve. This function can increase the gain of the video signal to a factor of two. It will reduce the gain again if it sees too many overflows (code 255) in any of the

R, G, or B channels. Adjustable via two parameters: user contrast and overflow limit. Parameters are I2C controlled.

The LVDS transmitter

This DS90C385MTD56 IC from National Semiconductors converts 28 bits of CMOS/TTL data into four LVDS (Low Voltage Differential Signalling) data streams. A PLL transmit clock is transmitted in parallel with the data streams over a fifth LVDS link. Every cycle of the clock, 28 bits of input data are sampled and transmitted. At a transmit clock frequency of 36 MHz, 24 bits of RGB data and 3 bits of display control data are transmitted per LVDS data channel. This IC operates at 3.3 V

For more information, see http://www.national.com/pf/DS/ DS90C385.html#Datasheet

Picture Mute

In some cases, it is necessary to mute the video output:

- In monitor mode:
 - During switch "on/off" of the monitor,
 - During source change,
 - During video or sync loss, or
 - By a user action (A/V-mute or mute)
 - In audio only mode (when the ICONN-box is
- In TV mode:
 - During switch "on/off" of the Monitor/Receiver box,
 - During source change in the Receiver box,
 - During video or sync loss, or
 - In audio only mode (Receiver box mutes the picture).

Most of the picture mute controls are done via the Pixel Works co-processor.

Anti Ageing

In order to prevent visible luminance differences, due to ageing of the monitor, a special algorithm is implemented. This algorithm is based on horizontal shifting of the picture in the monitor. For good understanding some terms will now first be explained:

- Ageing: The effect that the efficiency of a plasma cell (pixel) decreases as a function of the total time that it is illuminated. This effect occurs mostly because of phosphor ageing. As a result, the cell brightness decreases over time. An alternative name for ageing is "burn-in".
- Picture shifting: Fixed structures, like logo's, OSDs, and subtitles, will cause burn-in effects. The only way to mask this to a certain extends, is picture shifting so that the "burn-in" effect is smeared out over a larger area, and makes it less visible.

Most of the anti-ageing controls are implemented in the Pixel Works co-processor.

Horizontal

Horizontal anti-ageing steps:

- Step width/height, the step width/height shall be 1 horizontal pixel width (approx. 1 mm).
- Number of steps, the maximum number of steps in horizontal direction shall be 9.
- Time between steps, the time between the steps shall be 5 minutes.

The effect of H anti-ageing is a horizontal movement (start at 0):

$$0 \rightarrow 1 \rightarrow 2 \rightarrow 3 \rightarrow 4$$

$$12 \leftarrow 11 \leftarrow 10 \leftarrow 9 \leftarrow 8 \leftarrow 7 \leftarrow 6 \leftarrow 5 \leftarrow$$

$$\rightarrow 13 \rightarrow 14 \rightarrow 15$$

With the following sequence:

$$0 \rightarrow 1 \rightarrow 2 \rightarrow \dots \rightarrow 14 \rightarrow 15 \rightarrow 0 \rightarrow 1 \rightarrow etc.$$

After every step, the updated value is stored in NVM and gives an indication about the direction (0...4 and 13...15 to the right and 5...12 to the left).

The horizontal anti-ageing is a process, which is basically independent of any other processes that are running in SW. This means that this process should never be reset in order to get the best anti-ageing effect. Therefore, the horizontal shift positions and directions need to be stored in NVM, so that he anti-ageing process returns to its latest position after the set has been switched off or to standby. There is only one H and one V shift value for the anti-ageing process that is applicable for the AV1, AV2, and AV3 inputs.

Note: Horizontal shift cannot be done for sources that are screen filling and do not have sufficient overscan.

Vertical

V-shift is done in the F21RE Receiver box when the TV mode is active, or in the enhanced configuration when the monitor mode is active.

Vertical anti-ageing steps:

- Height/height, the height/height shall be one display line (approximately 1 mm).
- Number of steps, the maximum number of steps in vertical direction shall be nine.
- Time between steps, the time between the steps shall be 80 minutes, which equals one complete horizontal ageing shift (16 steps x 5 minutes).

The effect of V anti-ageing is a vertical movement (start at 0):

```
\uparrow
3 5
\uparrow
2
    6
    7
    \downarrow
    8
    9
          15
    10
         14
    11 13
          12
```

With the following sequence:

```
0 \rightarrow 1 \rightarrow 2 \rightarrow ...... \ \rightarrow 14 \rightarrow 15 \rightarrow 0 \rightarrow 1 \rightarrow etc.
```

After every step, the vertical shift position and its direction are stored in NVM. So the anti-ageing process returns to its last position after the set has been switched off (or to standby). Also, if by any cause (i.e. VGA-source selection or when service/factory mode is active), the anti-ageing process is stopped; the vertical shift position should be restored after resuming the anti-ageing process.

Audio processing (Diagrams SC13, 14 and 15)

This chapter describes the audio processing on the SCAVIO board. The circuit enables to connect several audio sources, selects the source on the desired input, and performs audio

processing and audio delay. It also matches the output signals for the Audio Amplifier panel.

The sound-related electronics are very straight forward, and consists of a Micronas MSP3415G sound processor, an active high pass, and low pass filter, and separate Class-D amplifiers for the woofers and tweeters.

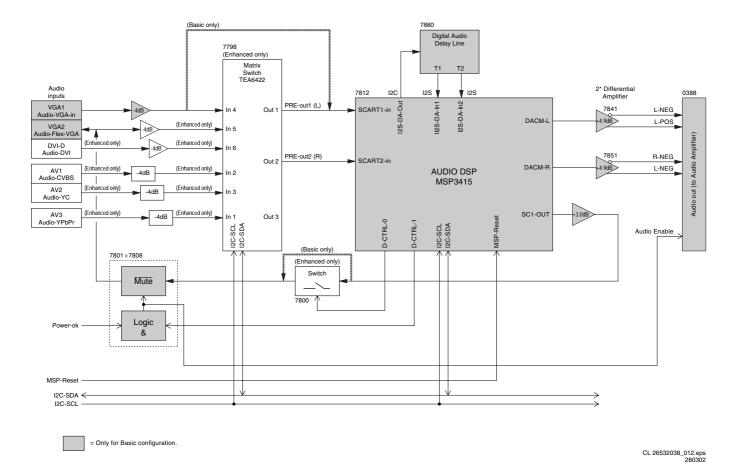

Figure 9-15 Audio Path

The processing part consists mainly of the following components:

- MSP3415G: a DSP sound processor from Micronas. This component is able to do all kinds of digital signal processing like volume, bass/treble, Ultra Bass, and balance. It has analogue inputs and outputs, as well as an I2S in/output used for digital audio delay.
- RAM with its logic to be able to store the I2S information for audio delav.
- Anti-plop/ mute circuit: which is necessary to prevent disturbances on the audio lines during start-up or
- TEA6422: a matrix switch of ST. This component is able to switch six inputs to three different outputs (only used in the Enhanced version).

MSP3415G

Ultra Bass

Because of the closed box implementation in this FM-chassis, a common DBE solution will not give an optimal bass performance. A closed box needs a substantial boost over a wide frequency range, while DBE operates in a limited frequency region.

Adaptive Ultra Bass 2 (UB2) is a suitable alternative. This feature is based on the psycho-acoustic effect of the missing fundamental, and gives the impression of a deep bass, while the loudspeakers do not reproduce these low frequencies. This feature is implemented in the MSP3415G. In the FM-chassis, this feature is always switched "on".

Audio delay

To compensate for "lip sync error" (the difference in time between the aural and visual perceptions), two different audio delays are selectable via the customer's menu (one for the Receiver box and one for the Monitor).

This is done at the audio processor IC7812 via an I2S bus and an additional delay circuit (IC7880 - 7882).

One can select delays of 24 ms (I2S_DATA_IN1) and 40 ms (I2S_DATA_IN2), or no delay.

In case of a delay, the AUDIO L/R IN is re-routed as I2S_DATA_OUT to the audio delay circuit and, depending on the selected delay, returned as I2S_DATA_IN1 or I2S_DATA_IN2, resulting in AUDIO_L/R_OUT.

Anti-plop/Mute

In several cases, it is necessary to mute the sound output. This muting is handled by the MSP sound processor, or by the Receiver box in case of TV-mode.

- In Monitor mode:
 - During switch "on/off" of the monitor.
 - During source change.
 - During video or sync loss, or
 - By a user action (A/V-mute or mute).
- In TV mode:
 - During switch "on/off" of the Monitor/Receiver box.
 - During source change in the Receiver box.
 - During video or sync loss, or
 - By a user action (mute).

Control (Diagrams SC7, 8 and 9)

Introduction

As a main controller, the so-called ARTISTIC is used, better known as OTC (On screen display, Teletext and Control). It is a 8051 (XA) based controller from Philips Semiconductors, the SAA5801H.

Although the OTC is the main controller, it acts as a "slave" when communicating with the Pixel Works IC via the I2C-bus 2.

When the monitor is connected to an F21RE Receiver box, the UART commands from the Receiver box will control the monitor.

In stand-alone mode, the monitor can be controlled via the Remote Control or via the RS232C port.

DDC1/2B (Display Data Channel, an I2C based protocol) is implemented with separate NVMs for the two VGA inputs and the DVI-D input as well.

It is also possible to use the RS232C port for software upload to the PW Scaler and the OTC. The target for downloading is controlled via a switch in the RS232C path; the switch itself is controlled by the OTC.

OTC Processor

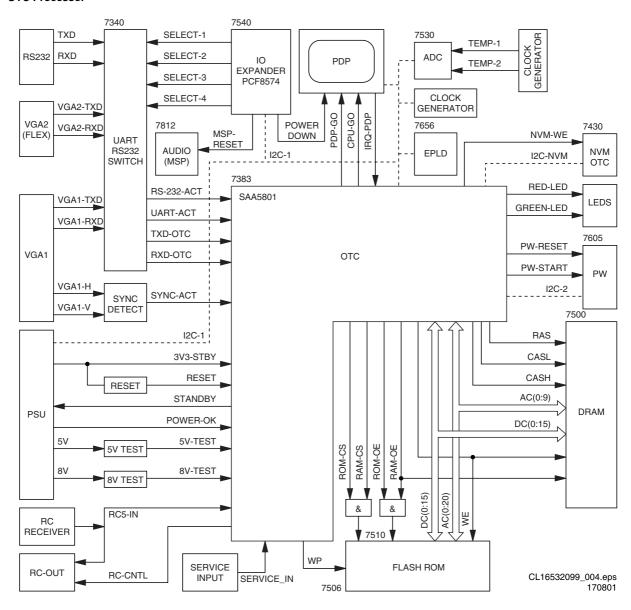

Figure 9-16 Control Part

This part describes the Main Control part of the SCAVIO panel and the interfaces with the software. The control function consists of the following tasks:

- Control of external IOs, like fan speed, temperature, service and RC5.
- UART communication with Receiver box,
- RS232 control / communication,
- Supports the uploading of new SW into the Flash-ROMs,
- Start-up of monitor and initialisation via I2C,
- Error detection and storing.

Start-up and Shut-down

The POR signal is not generated on the PSU, but on the SCAVIO board. This is done with a fully integrated ADM810T POR chip (item 7517), which senses the 3.3 V coming from the PSU. The sense level is 3.08 V. During power-up as well as power-down, this chip will make the RESET signal high. During power-up, this signal will be held "high" until 240 ms after V_cc has become stable.

During power-down, the system will be reset as soon as the V_cc drops below 3.08 V.

Start-up from Standby

When the monitor is in standby mode, it can wake-up in several wavs

FM23, FM24, FM33

- When an RC command is received (RC_IN).
- Detection of H- and/or V-sync on VGA1.
- Detection of UART communication on VGA1.
- Detection of BS232 communication
- Detection of Service modes.

RC Command Reception

When a RC command is received at the RC receiver on the LED panel, it will go directly to the RC input of the OTC (RC_IN on pin 100). If the monitor is in standby, and a proper RC command is send, it will wake up.

The RC commands are routed to the Receiver box via the VGA1 connector pin 9 (RC_VGA1), but this loop through connection is controlled by RC_CNTL. Below is the truth table.

Table 9-5 RC Commands overview

FTV2.1E-box	FTV Monitor	RC commands	RC_CNTL	
In Standby	In Standby	Send to E-box	Low	
In Standby	On	Blocked	High	
On	In Standby	Send to E-box	Low	
On	On	Send to E-box	Low	

Note: All RC commands are direct available on a separate RCout cinch connector (RC_OUT) on the VGA connector panel.

H- and/or V-sync Detection

When both H and V sync signals are present on VGA1, there is a pulse (low) on SYNC_ACT. When only H is present, SYNC_ACT is continuously low. The SW disables the interrupt, once an interrupt is received.

UART Communication Detection

When there is UART communication on VGA1, the UART detection circuitry generates on every falling edge a pulse on UART_ACT. This is a negative going pulse with a width of \pm 470 us. The first pulse will trigger the main software to check for the FTV System Protocol (FSP). The SW disables the interrupt, once an interrupt is received.

RS232 Communication Detection

When an RS232 connection is made, and communication is started (pulses on RS232_RXD), RS232_ACT becomes "high". Via a transistor, RS232_ACT will make SERVICE_IN low. When the Monitor is operating (+5 V available), this signal is made low (in fact it is disabled).

Service Mode Detection

It is possible to enter four different Service Modes (provided the OTC is still supplied by the +3V3_STBY).

Via the SERVICE_IN signal, which is an ADC input of the OTC, a voltage drop is detected from +3.3 V to V_x.

V_x is a DC voltage, which represents the mode to be entered:

Table 9-6 Service Mode levels

Service mode	Limits Vx [V]	Vx [V]	Remarks		
SDM	3.0 > Vx > 2.4	± 2.6	0382-2 to GND		
SAM	2.4 > Vx > 1.8	± 2.0	0382-4 to GND		
COMPAIR	1.8 > Vx > 1.2	± 1.4	0382-6 to GND		
RS232 active	Vx < 0.8	>0.8	Plug in RS232, start program		

There are five I2C busses used in the monitor (see also "I2C Overview" in chapter 6):

- I2C bus 1 is a (5 V) device bus, controlled by the OTC, and connected to the following devices:
 - PDP.
 - EPLD.
 - IO expander SCAVIO PCF8574A.
 - IO expander PSU PCF8574A.
 - ADC PCF8591.
 - Clock generator for PW FS6377.
 - Sound processor MSP3415G.
 - Audio switch TEA6422 (Enhanced version only).
- I2C bus 2 is used for communication with the Pixel Works co-processor (PW). Although the OTC is the main controller, it will act in this case as a "slave", since the PW can only act as a "master". Before any I2C commands are exchanged, the PW gets an interrupt (PW_START) to indicate that the OTC wants to talk to the PW.
- I2C bus 3 is a (3.3 V) device bus, controlled by the PW, and connected to the following devices:
 - Video Decoder SAA7118 (Enhanced version only).
 - De-interlacer SDA9400 (Enhanced version only).
 - ADC/TMDS receiver AD9887.
 - 3D Comb filter MN8783LSI (optional).
- I2C bus 4 is a (3.3 V) bus between the OTC its NVM (to avoid data corruption).
- I2C bus 5 is a (3.3 V) bus between the PW and its NVM (to avoid data corruption).

Notes:

- The PDP and EPLD are in fact 3.3 V bus devices, but they need to be connected to bus 1, since the OTC is the first controller to be fully operating at start-up. For this reason, an I2C level shifter (items 7675/76 on diagram SC12) is included, which converts the 5 V signals into 3V3 and visa versa.
- One of the first commands is to set the clock generator (item 7570), else the PW can not start-up.

RS232/UART

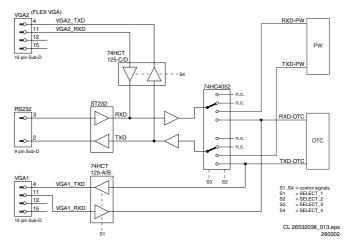

Figure 9-17 RS232/UART

The FM23 monitor is equipped with an RS232 interface. Via a nine pin Sub-D connector, it is possible to connect a PC for special modes like:

- SW download.
- Factory purposes.
- Service.
- Professional use.

A second option is the connection of a so-called ICONN-box for Institutional TV (Hotel TV).

For communication with the Receiver Box, the UART protocol is used, because this can handle longer cable distances than I2C. The (Receiver box) UART is interfaced via a 15 pin Sub-D connector (VGA connector). Via this UART connection, the F21RE Receiver box and the FM23 Monitor can communicate (via FSP). By doing so, the monitor will know that there is an

Receiver box connected and thus it is operating as a TV configuration.

RS232/UART Control

The OTC (SELECT_1 to _4) controls the RS232/UART switches. When the monitor is in Receiver box mode, there is no RS232 communication possible. The monitor is default set in Receiver box mode (switch to n.c. position) and the UART from/to VGA1 is enabled, to allow communication with Receiver box

If no Receiver box is detected, the UART is disabled to ensure that there will be no communication towards the OTC, and the switch is set to OTC. Below the truth table of the switches is shown, which determine the TXD/RXD path.

Table 9-7 RS232/UART Control

S1= SELECT_1 (P0)	S2 = SELECT_1 (P1)	S3 = SELECT_1 (P3) (3)	S4 = SELECT_4 (P4) (4)	UART VGA1 (E-box)	UART VGA2 (flex)	RS232 set to OTC (1)	RS232 set to PW (2)
0	0	0	0	0	0	0	0
0	0	0	1	0	0	0	0

1	1	1	0	0	1	0	0
1	1	1	1	0	0	0	0

- (1) Software download or ComPair mode.
- (2) Software download or Debug mode.
- (3) When S3 = 1 the 74HCT4052 is in a tri-state ("off" state).
- (4) When S4 = 0 the TXD out of RS232 is disabled (S4 may not become low in any other case).

UART Detection

When the VGA1_RXD line is continuously "low", the OTC might run slow due the fact that so-called "break" signals are generated. To prevent this, a small circuitry is added to detect whether VGA1_RXD is continuously "low" (item 7310). When the VGA1 RXD line is "low" for about 20 ms, the bufferswitch (item 7303-A) is opened. After this buffer, a second discrete buffer is placed (items 7315/16), which keeps the RXD_OTC line "high" and changes the 5 V into a 3.3 V level.

ICONN-box

For application of a Flat TV in a hotel environment, the monitor is designed to operate with a so-called ICONN-Box. The ICONN-box will take over the user control of the monitor, by intercepting the RC5-commands coming from a dedicated RCtransmitter, which sends specific hotel-mode commands and sending its own RC-commands to the microprocessor in the monitor.

So in the ICONN-Box, the hotel-mode commands will be converted to RC5-commands, which than can be interpreted by the monitor.

When connected to the RS232 input, this box takes over the control of the IR-receiver in the monitor. It is also able to control the front LED. The switches (7550 for the IR and 7555 for the LED signals) are controlled by the ICONN_NOT signal.

The ICONN-Box shall interface the Monitor with the following signals:

- IR-RX. These are the RC5-commands coming from the specific hotel RC5 - transmitter, which are received via the RC5-receiver of the monitor.
- IR_TX. These are the RC5-commands generated by the ICONN-Box and send to the monitor.
- RL_ICN. Control signal from the microprocessor (of the monitor), indicating the power state of the monitor. The ICONN-Box and monitor LED are driven in parallel.
- GL_ICN. Control signal from the microprocessor (of the monitor), indicating the functionality of the monitor, to drive the LED on the ICONN-Box.
- LD_ICN. Control signal from the ICONN-Box to drive the green LED on the monitor.

9.5 Audio Amplifier Panel (Diagram A)

Introduction 9.5.1

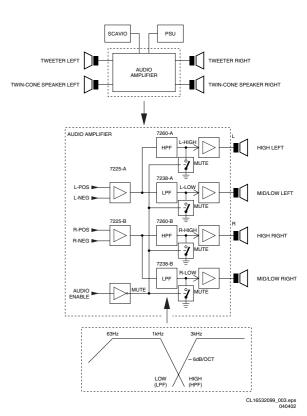

Figure 9-18 Block diagram Audio Amplifier

This panel houses the audio filters and amplifiers necessary for driving the speakers. The differential audio inputs (for common mode immunity) come from the SCAVIO panel (via connector

The PSU delivers the positive and negative supply voltage of 14.5 V_dc, as well as the +9V_STBY voltage.

After being filtered and amplified, the signals go to the speaker section, where the (twin cone) low/mid range speakers and the tweeters are driven (load impedance is 8 Ω). Shielding of these speaker magnets is not needed for a plasma screen.

Because of the limited space (no room for a bass reflex pipe), the closed box" principle has been chosen. This, in combination with the "Adaptive Ultra Bass 2", results in an acceptable bass performance.

In order to guarantee this good bass performance, the closed box has to be airtight. This is achieved by a closely fitting foam ring between the front and back part of the cabinet.

9.5.2 Supply (Diagram A7)

The supply voltage is a symmetrical voltage of +/- 14.5 V_dc, generated by the main supply via L5002.

- V_SND_POS on connector 0302 pin 5/6, and
- V_SND_NEG on connector 0302 pin 1/2.

9.5.3 Filter (Diagram A2)

Electrical filtering is needed for following reasons:

- Limiting the cone excursion, thereby reducing the
- Increasing the power handling capacity (PHC). In this amplifier panel, active second order Sallen-Key filters are used, with crossover frequencies of 1 kHz for the low pass filter, and 3 kHz for the high pass filter.

The audio signals are filtered **before** the amplifier. There are some reasons for doing this:

- It is now easy to do active filtering, and
- At less costs (no expensive coils and capacitors).

Low Pass Filter (LPF)

For L and R separately, a Low Pass Filter (IC7238A and B) is processing L_LOW and R_LOW.

The output signal of this filter is then fed to the audio amplifier (identical for right channel).

High Pass Filter (HPF)

For L and R separately, a High Pass Filter (IC7260A and B) is processing L_HIGH and R_HIGH.

The output signal of this filter is then fed to the audio amplifier (identical for right channel).

Amplifier (Diagrams A3 to A6) 954

Each speaker has its own 15 W class-D amplifier. These socalled SODA (Self Oscillating class-D Amplifier) amplifiers combine a good performance with a high efficiency, resulting in a big reduction in heat generation.

Principle

Audio-power-amplifier systems have traditionally used linear amplifiers, which are well known for being inefficient. In fact, a linear Class AB amplifier is designed to act as a variable resistor network between the power supply and the load. The transistors operate in their linear region, and the voltage that is dropped across the transistors (in their role as variable resistors) is lost as heat, particularly in the output transistors. Class D amplifiers were developed as a way to increase the efficiency of audio-power-amplifier systems.

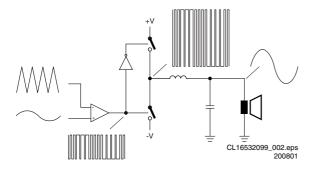

Figure 9-19 Principle Class-D Amplifier

The Class D amplifier works by varying the duty cycle of a Pulse Width Modulated (PWM) signal.

By comparing the input voltage to a triangle wave, the amplifier increases duty cycle to increase output voltage, and decreases duty cycle to decrease output voltage.

The output transistors (item 7365 on diagram A3) of a Class D amplifier switch from "full off" to "full on" (saturated) and then back again, spending very little time in the linear region in between. Therefore, very little power is lost to heat. If the transistors have a low "on" resistance (R_DS(ON)), little voltage is dropped across them, further reducing losses. A Low Pass Filter at the output passes only the average of the output wave, which is an amplified version of the input signal. In order to keep the distortion low, negative feedback is applied (via R3308). A second feedback loop (via R3310) is tapped after the output filter, in order to decrease the distortion at high frequencies.

The advantage of Class D is increased efficiency (= less heat dissipation). Class D amplifiers can drive the same output power as a Class AB amplifier using less supply current. The disadvantage is the large output filter that drives up cost and size. The main reason for this filter is that the switching waveform results in maximum current flow. This causes more loss in the load, which causes lower efficiency. An LC filter with a cut-off frequency less than the Class D switching frequency (350 kHz), allows the switching current to flow through the filter instead of the load. The filter is less lossy than the speaker, which causes less power dissipated at high output power and increases efficiency in most cases.

9.5.5 Mute (Diagram A2 to A6)

A mute switch (item 7302) is provided at the PWM inputs (item 7315, LM311). This switch is controlled by the AUDIO_ENABLE line, which checks the availability of the +9V_STBY voltage.

956 **Protections**

Short-circuit Protection (Diagram A3)

A protection is made against a too high temperature of transistor 7355 in case of a short-circuit of output FET 7365-1. Transistor 7340 is sensing the current through transistor 7355 via R3355, and activates the DC-protection line (see figure "DC protection") in case the current becomes too high. This is the same for all four amplifier parts.

DC-protection (Diagram A7)

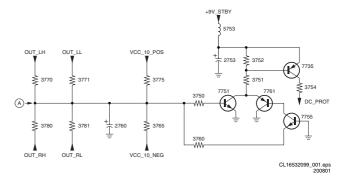

Figure 9-20 DC Protection

Because of the symmetrical supply, a DC-blocking capacitor, between the amplifier and the speaker, is not necessary. However, it is still necessary to protect the speaker for DC voltages.

The following protections are therefore implemented:

- Via R3765 and R3775, each stabilised supply voltage line (via items 7735 and 7745) is checked on deviations.
- Via R3770/3771/3780/3781, each amplifier output is checked for DC-voltage.

Both cases will make T7735 conduct, so that the DC-PROT signal will be made high. This ensures that the power supply is rapidly trimmed back.

Capacitor C2760 will ensure that only DC-signals at point A will activate the protection.

9.6 LED/Switch Panel (Diagram LD)

This panel contains:

- The red and green status LEDs,
- The RC input receiver,
- The light sensor, and
- The "on/off" switch.

All signals on this panel come directly from the SCAVIO panel:

- The LED and sensor signals (RED_LED, GREEN_LED and LIGHT_SEN_IN) are routed to the OTC. When a F21RE Receiver box is connected, the sensor signal is routed to the OTC of this box (via UART), where it will control the HOP via I2C.
- The RC signal (RC_IN) is routed to the OTC, the VGA1 connector, and the RC-out cinch connector.
- The signals to (+9V_STBY) and from (+9V_STBY_SW) the "on/off" switch are routed to the PSU board.

9.7 Plasma Display Panel (PDP)

9.7.1 General

The PDP, which is used in this chassis, is a product of Fujitsu Hitachi Plasma Display Ltd (FHP). When defect, a new panel must be ordered, and after receipt, the defective panel must be send for repair in the packing (flight case) of the new ordered panel.

9.7.2 Operation

Principle

Plasma displays work by applying a voltage between two transparent display electrodes on the front glass plate of the display. The electrodes are separated by an MgO dielectric layer and surrounded by a mixture of neon and xenon gases. When the voltage reaches the "firing level", a plasma discharge occurs on the surface of the dielectric, resulting in the emission of ultra violet light.

This UV light then excites the phosphor material at the back of the cell and emits visible light. Each cell or sub-pixel has red, blue or green phosphor material and three sub-pixels combine to make up a pixel. The intensity of each colour is controlled by varying the number and width of voltage pulses applied to the sub-pixel during a picture frame. This is implemented by dividing each picture frame into sub-frames. During a subframe, all cells are first addressed - those to be lit are precharged to a specific address voltage - then during the display time the display voltage is applied to the entire screen lighting those that were addressed.

Each sub-frame has a weighting ranging from 1 time unit to 128 $\,$ time units for a typical eight sub-frame arrangement (Time Unit depends on size and number of pixels on the screen). This is a purely digital PWM control mechanism, which is a key advantage as it eliminates any unnecessary digital to analogue conversions, making the PDP technology ideal for the all-digital age.

Achieving High Resolution

While conventional technology, as found in standard VGA resolution screens, uses 2 display electrodes for each horizontal line, applying the same method to achieve higher resolution (>1000 horizontal lines) brings inherent problems. Firstly, the number of electrodes would need to be doubled which would require very high precision production processes. Secondly, the cell aperture ratio would reduce resulting in lower brightness. In addition, either the driving scheme would have to operate with double the speed, again introducing significantly higher cost, or a dual-scan technique would have to be introduced. With dual-scan, twice as many driving ICs would be required. In summary, implementing high resolution with conventional technology would result in lower brightness and increased costs.

ALiS Technology

To achieve high brightness as well as cost-effectiveness, FHP developed ALiS (Alternate Lighting of Surfaces) Technology. ALiS is based on 3 principles:

- Odd and Even lines are displayed separately
- The non-lighting area between the cells is utilised
- The number of electrodes = the number of horizontal display lines + 1

Despite the smaller cell size, the aperture ratio can be increased from 40% to 65% meaning that the screen is inherently brighter. Another spin-off benefit is that the lighting duty is reduced to 50% (odd fields and even fields lit for half of each frame) meaning that a significantly improved phosphor lifetime can be expected.

For more information, see http://www.fme.fujitsu.com/ products/displays/pdp.html
